At a special meeting of the stockholders of the Tennessee Railway, Light & Power Company, Chattanooga, Tenn., on May 19, the plan calling for the sale of all the assets of the company was ratified. The plan, the details of which already have been made public, will now become effective, E. W. Clark & Company, Bonbright & Company, H. M. Byllesby & Company and Hodenpyl, Hardy & Company, who are large holders of preferred and common stock, having previously expressed their intention as stockholders to exchange their stock and exercise their full subscription rights to the new issues provided under the terms of the plan.

These firms have agreed to underwrite without compensation the second preferred and common stock of the new company offered for subscription and not taken by the stockholders. They will also participate in a small commission offered alike to all bankers and brokers for service rendered in connection with the deposit of securities under the plan.

Through the approval of this plan the company will be enabled on June 1 to face its maturities aggregating $3,561,000, it being the opinion of the stockholders as well as that of the board that the plan is the best means of caring for these obligations and protecting the interests of the company.

Employees Purchase 40 per Cent of Stock Issue

In two days time 480 of the 600 employees of the Wisconsin Gas & Electric Company, Kenosha, Wis., purchased $200,000 of the company's issue of $500,000 of 7 per cent preferred stock. According to the custom of that company the issue was to be sold directly to the public in small amounts. However, before opening the public sale, an opportunity was given the employees of the company to become shareholders. Notwithstanding heavy purchases by them in the past of stocks and bonds or notes of the company, 480 of them came forward in two days time and absorbed two-fifths of the issue. The purpose of the company in floating this $500,000 issue is to finance its 1922 program of service improvements, betterments, etc. The offering was referred to in the ELECTRIC RAILWAY JOURNAL, May 13, page 805, in reciting results of the Milwaukee stock campaign.

Suggestion that Taxpayers Share Cost of Improvements

Philadelphia Rapid Transit President Favors City Ownership of Railways with Private Operation and a Share in the Profits for the Management and Men—His Magnum Opus in New Drive

THOMAS E. MITTEN, president of the Philadelphia (Pa.) Rapid Transit Company, says that the ultimate answer to the transit situation there lies in city ownership of all subways, elevated and surface tracks under company operation, with co-operative accomplishment rewarded by added compensation to men and management. He says that the cost of added transit should be properly apportioned as between general taxation and assessment of benefited property. His suggestion is that the company supply cars, power and movable equipment and operate under lease, revocable by the city, with assumed protection of the company's investment and a reasonable return thereon.

Mr. Mitten's suggestions are contained in a twelve-page pamphlet addressed to the Mayor of Philadelphia, members of the City Council, the Public Service Commission, the joint transit committee, P. R. T. stockholders and interested citizens generally. The pamplet is called the "Rapid Transit Handbook." Mr. Mitten's conclusions follow:

Higher fares discourage increased riding and interfere with the extension of home building areas, thus nullifying the main justification for use of municipal funds in aid of added transit.

Inability to collect sufficient revenue in fares to meet costs of operation, and in addition pay the interest on city investment, makes necessary the use of some other means to avoid overburdening city credit.

There being no inducement for further investment of private capital, municipal funds, or those secured through assessment of benefited property, must be depended upon for future transit development.

Subway and elevated lines relieve surface street congestion to advantage of general vehicular and pedestrian traffic. This, with increased values of public or other property, not subject to special assessment for added transit would justify general taxes bearing a share of the costs of rapid transit developments.

Failure to assess some portion of the costs of added transit upon property owners who are specially benefited, exhausts the city's borrowing capacity and thus prevents property owners from getting other improvements to which they may be properly entitled.

Liberal treatment of earlier investment is justified because of the risks taken by original pioneers in developing transit; but a continuation of the present plan of building subways benefiting private property, which takes no risk whatever, is without any such justification.

A commission of public spirited citizens, representing the real estate and commercial interests, could, in co-operation with the city and the company, together best plan for added transit.

According to Mr. Mitten Philadelphia's future depends largely upon proper development of adequate transit. He says the city and company should co-operate to provide a satisfactory system, deriving every possible benefit from knowledge gained by experience in this and other cities.

Philadelphia increased the fare from 5 cents to 7 cents cash—four tickets for 25 cents—Nov. 1, 1920. In 1921 75,000,000 fewer passengers were carried; that is, 835,000,000, against 910,000,000 in 1920.

According to Mr. Mitten the greatest loss of passengers has been in the best paying class—the short riders. He says that passengers using free transfers continue to ride, but their fares seldom pay the cost of the service. Passengers carried in Philadelphia in 1920 increased 36 per cent as compared with 1916. Brooklyn, the system nearest approximating Philadelphia in size and conditions, showed during this period increased riding of but 12 per cent. Philadelphia, with increased fare, in 1921 carried 8 per cent fewer passengers than in 1920. Brooklyn, with fare unchanged, showed increased riding of 8 per cent.

Mr. Mitten says that New York and Chicago are likewise fairly comparable with each other. Chicago, with increased fare, in 1921 carried 2 per cent fewer passengers than in 1920. New York, with fare unchanged, showed increased riding of 5 per cent. Boston, in 1921, with a 10-cent fare, carried 12 per cent fewer passengers than in 1917 with a 5-cent fare.

New York and Brooklyn, with the basic 5-cent fare unchanged, says Mr. Mitten, show increased riding, but cannot meet expenses. Philadelphia, Chicago and Boston, with increased fares, show heavy loss in passengers carried, and have not increased their revenue sufficiently to justify the expectation that further increase in fares would be followed by a sufficient increase in revenue to pay interest on added investment required to perfect the service.

In continuing Mr. Mitten says:

Reduced Rentals

Philadelphians have been persuaded to the belief that much is to be expected from a decrease in the rentals paid by P. R. T. under lease to the underlying companies. To secure a proper perspective, one must understand that the city itself admitted, in the testimony of its director of city transit before the Public Service Commission of Pennsylvania in 1918, that $129,000,000 of capital was actually paid in. This sum should not be construed as being the full total of the investment made by underlying companies, as they are known to have enlarged property out of earnings, neither do their fixed capital accounts represent the various necessary structural overhead costs sanctioned by the commissions and courts. Furthermore, this sum shows no recognition of substantial sums paid by underlying companies to consolidate competing lines into a unified system.

The Public Service Commission, before whom valuation proceedings are now being conducted, cannot deal with the question of underlying rentals, but must, under the law, base its conclusion as to the rate of fare, upon the present value of the used and useful property.

Reducing the cost of providing transit, by decreasing the rentals or other form of return now being paid to underlying companies, has many advocates. Justice, however, prompts the recollection that original pioneers in early transit made no such profit from street railway investment as did those who invested in property abutting street railway lines.

City growth to present areas, and city's great advantage by increased taxable values, are both in large measure due to pioneers of street railway development, who successively scrapped horse cars, cable cars and the original four-wheel trolley, in favor of improved method and larger cars. This ladder, upon which cities climbed to their present status, cannot in fairness be thrown down without a reasonable consideration of the equities involved.

The Philadelphia Rapid Transit in 1907-8 started its Market Street subway-elevated line, and in 1919, according to Mr. Mitten, was more than $5,000,000 short of having earned 6 per cent upon the actual money invested, while the city advantaged by $113,000,000 abnormal increase in West Philadelphia taxable values alone. Owners of abutting property also secured great advantage from increased values, without contributing to the cost.

Philadelphia has appropriated to city transit construction the following designated and ear-marked items:

Frankford elevated		$15,000,000
Broad Street subway	$28,000,000	
Delivery loop	7,600,000	35,600,000
Byberry surface line		1,200,000
Darby elevated		4,200,000
Parkway-Roxborough subway-elevated		7,500,000
Chestnut Street subway		5,000,000
Real estate and sewers		2,700,000
Total appropriation		$71,200,000

Expenditures to March 31, 1922, from loan and general funds, have been as follows:

Frankford elevated		$9,102,745
Broad Street subway	$3,641,225	
Delivery loop	1,578,637	5,219,863
Byberry surface line		382,127
Sewer relocation		489,014
Real estate		491,460
Deficiency items		336
Salaries, office expenses, etc.		1,142,594
Carrying charges (interest and sinking fund)		4,184,714
		$21,012,854
Contracts placed or pending		5,900,000
Total expenditure		$26,912,854

Mr. Mitten says that this idle investment has already cost the taxpayers of Philadelphia more than $4,000,000 in interest and sinking fund charges. He says that city investment in transit should not be increased without a definite plan for financing additional high-speed lines, since none of those to which the city is now committed, can be made to earn interest on construction costs. He then goes on:

Greater New York's borrowing capacity does not permit of any material expenditure for added transit. Interest has been earned only upon the relatively small city investment of $59,000,000 in original subways, but on the $230,000,000 in new subways there is an accumulated deficit of $44,850,000. New York City taxpayers must bear the shortage, which for 1921 exceeded $9,500,000.

Boston, with $43,000,000 of public money invested in transit, for three years, showed a deficit of about $5,000,000.

Philadelphia should take advantage of that most important element left out of account in Boston and New York and make the property owner pay, into the public treasury, some portion of his profits from transit development, to help pay for its cost.

Digitized by Google

COMPARATIVE RESULTS

Showing, in the case of Philadelphia and Chicago, decreased traffic following increased fare, as compared to well sustained annual increase in passengers carried at Brooklyn and New York with fares unchanged.

TOTAL PASSENGERS CARRIED

Philadelphia (Fare Increased in 1920)		Brooklyn (Base Fare Unchanged)
670,000,000	1916	765,000,000
910,000,000	1920	855,000,000
835,000,000	1921	920,000,000
Increase 36 per cent	1920 over 1916	Increase 12 per cent
Decrease 8 per cent	1921 over 1920	Increase 8 per cent
Chicago (Fare Increased in 1920)		**New York (Base Fare Unchanged)**
1,390,000,000	1916	1,480,000,000
1,540,000,000	1920	1,705,000,000
1,515,000,000	1921	1,785,000,000
Increase 11 per cent	1920 over 1916	Increase 15 per cent
Decrease 2 per cent	1921 over 1920	Increase 5 per cent

CITY PAVING

Cleveland, Ohio, by many considered the best example of service-at-cost plan, now requires abutting property to share the cost of surface street railway extensions. Cleveland has, for some years past, endeavored to relieve its street railways of paving costs and other taxes, in an effort to secure adequate service at minimum cost.

Costs of city paving and other forms of taxation should not be added to the cost of car rides under present conditions. City action is required to eliminate such items of expense, and also, by traffic regulation, to free street railway tracks from vehicular interference, and thus reduce delays and make possible the operation of additional cars, with a consequent larger percentage of seats supplied to number of passengers carried.

BENEFITED PROPERTY ASSESSMENTS

The City Club of New York, in a report based upon a survey of the aggregate rise in land values in Manhattan and the Bronx, found that the property owners benefited in the districts served could have paid the entire cost of the subway, $43,000,000, and still have had a profit on their increased land values of $37,500,000, created solely by the construction of the subway. City Club says:

"In view of this fact, would it not be reasonable to require property benefited in outlying districts to pay for the cost of a rapid transit line built to serve it?"

Mr. Mitten then quotes from the report of the Federal Electric Railways Commission to the President in August, 1920, in which that commission urged that in every community (where and to such extent as may be practicable) consideration be given to the advisability of requiring extensions and rapid transit systems of subway and elevated to be paid for, not out of new capital invested through the medium of bonds or stock (which means for all time an added burden upon the car rider) but from special taxes assessed against the owners of property in the district, the value of which is enhanced by such extensions. In commenting along these lines Mr. Mitten says:

Legislation defining city-built transit as a local improvement, the cost of which may be assessed upon property benefited thereby, was written into the rapid transit act of New York State by the amendment of 1909.

Pennsylvania's Commission on Constitutional Amendment and Revision adopted a provision by virtue of which all property benefited may be assessed to pay the cost of city-built transit. While the sanction to call the constitutional convention in Pennsylvania was denied by the electors at the 1921 primaries, there is an increasing sentiment that this principle of assessing cost on the property benefited should be written into the law, so that the municipality may build needed rapid transit lines, without overburdening general tax budgets to make up deficiencies in transit carrying charges.

San Francisco has successfully applied this principle. The Twin Peaks Tunnel project, involving an expenditure of about $4,500,000, was undertaken for the purpose of providing rapid transit to the southwesterly corner of the city, comprising approximately 4,000 acres of desirable home sites, otherwise practically isolated from the business section of the city by the Twin Peaks range of hills. The Bureau of Engineering, City of San Francisco, in a report dated July, 1921, states that the money for this entire project was provided by assessment on the property benefited.

The Board of Local Improvements of the city of Chicago in 1921 recommended the construction of a system of subways. Michael J. Faherty, chairman of the board, said:

"A subway in any district will result in the landlords boosting rents. The tenant will have to pay the increased rents whether subways are built by special assessment or in other ways. My plan is to make the landlord pay part of his increased income toward subway construction."

Mr. Faherty estimated that one-sixth of the additional income-producing power of benefited property would entirely pay for the subway.

One advantage of applying the principle of assessing property for benefits received, is that it acts as an automatic check to the demand for unwarranted extensions. If the land to be benefited is not able to stand the burden of any assessment, then it is evident that the development is premature.

MEN AND MANAGEMENT

Effective management is essential to satisfactory service. The law of Pennsylvania provides for reward of efficient management by authorizing participation in such resulting profits as shall be established before the Public Service Commission.

Men and management co-operating in Philadelphia, during the period 1911-1921, created added annual net income of $16,000,000, through patronage induced by developing the short riding habit, savings through increased production, elimination of waste and reduction in accident costs. During this period, rides per capita were doubled without increasing the number of men employed.

A TALE OF THREE CITIES

Showing how Philadelphia, 1910-1920, under Mitten management, compared, in results of operation and average rate of fare, with Brooklyn and Pittsburgh during the same period

Comparative Statistics, 1910	Philadelphia	Brooklyn	Pittsburgh
Gross operating revenue	$18,839,413	$20,906,930	$10,250,937
Operating expenses	10,156,013	11,726,392	6,092,028
Net operating revenue	$8,683,400	$9,180,538	$4,158,909
Taxes	1,582,336	1,454,213	427,128
Operating income	$7,101,064	$7,726,325	$3,731,781
Population	1,549,008	1,634,351	942,108
Total rides per capita	288	348	247
Average fare—total passengers, cents	4.13	3.60	4.32
Comparative statistics, 1920	**Philadelphia**	**Brooklyn**	**Pittsburgh**
Gross operating revenue	$38,807,354	$41,414,352	$21,322,503
Operating expenses	26,593,913	34,666,132	18,318,386
Net operating revenue	$12,213,441	$6,748,220	$3,004,117
Taxes	2,601,253	2,201,653	662,222
Operating income	$9,612,188	$4,546,567	$2,341,895
Population	1,823,779	2,018,356	1,094,809
Total rides per capita	501	447	293
Average fare—total passengers, cents	4.15	4.39	6.48

Co-operative accomplishment makes for good service. Commenting upon the then proposed contract with Pittsburgh Railways, Mayor Magee, formerly a public service commissioner, was quoted in Pittsburgh newspapers as saying:

"A clear cut provision should be added that will permit of a reward to the company for its efficiency, either due to decreased expenses or an increase in the riding habit of the public. . . . I look upon such a clause as being the most important, perhaps, of any that could be inserted in the contract. The revolutionary changes by the management of the street railways of Philadelphia have brought advantages to the car riders, because of wise management, that are so surprising as to be almost unbelievable."

Such a provision was embodied in the Pittsburgh contract, which is now in force.

Company Estimates Uniform

Time for Giving Decision on Toronto Arbitration Extended to Oct. 1—City's Side Being Presented

A synopsis of the evidence presented before the arbitration board in the Toronto (Ont.) Railway case by various experts as to the present value and the reproduction or replacement value of the railway's equipment has been published from time to time in the ELECTRIC RAILWAY JOURNAL. As a result of the application before the Appellate Court of Ontario by the counsel for the city corporation, some of the figures have recently been made public which were given by the different experts together with the cost as shown by the Toronto Railway's books, the court having granted the application by the city corporation for production of the figures.

Counsel for the city are now presenting their side before the arbitration board. It may be possible at a later date to give a summary of the evidence produced by the city's experts.

Appraisals have already been submitted by the company's experts. In each of these cases the valuations put in include all the assets of the company, while the city's experts are submitting appraisals of different portions of the assets like rolling stock, tracks, buildings, etc., which mean valuating on a different basis.

The time for making the award of the board, which was originally fixed for March 1, has been extended to Oct. 1, in order to enable the city corporation to complete its evidence.

Corporation Makes Its Annual Report to Commission

The Los Angeles Railway Corporation, operating in Los Angeles, has made its report to the State Railroad Commission for the year 1921, reporting that its operating revenue was $10,121,517 and operating expenses $8,232,577, giving a net operating revenue of $1,888,939; miscellaneous non-operating revenue amounted to $119,494. Interest, rent, taxes and other deductions totaled $1,788,005. The net corporate income for the year was $220,429. The deficit at the beginning of the year amounted to $975,014. Miscellaneous additions to the surplus of the company for 1921 amounted to $3,036, and miscellaneous deductions were $413,316.

Railway Must Earn Its Way

The Tacoma Municipal Railway, serving the tideflats district, will have to earn its way hereafter or go out of business. This is the conclusion of City Attorney J. Charles Dennis, from the press reports of the decision of the State Supreme Court, handed down recently in the case brought by the citizens of Seattle to prevent the use of general fund money to pay any claims arising out of the purchase or operation of the Seattle street car system.

The Tacoma municipal line now owes the general fund $145,320 in loans made the railway operating fund in the past four years to cover interest charges. In addition, there was due at the first of the year $13,111 in interest on bonds for the payment of which no funds were available.

The court decision comes just in time to clarify the city's case in the matter of the U. S. Shipping Board loan on the municipal line, and City Attorney Charles Dennis has wired the Shipping Board of the court decision. When the Shipping Board loaned $223,000 to the city for double-tracking the tideflats line, the contract with the city contained a clause to the effect that 25 per cent of the receipts were to be set aside for interest and redemption charges and if this were not sufficient to meet the charges, the general fund should pay the difference. The Supreme Court, in the recent Seattle decision, has apparently nullified this clause, City Attorney Dennis states.

Discontinuance Application Heard

The Public Utilities Commission of Connecticut at Hartford, Conn., on May 17 heard the petition of the Connecticut Company for the discontinuation of the interurban service that operates between the cities of Hartford and Rockville for the major part over the steam tracks of the New Haven road.

President Lucius S. Storrs, representing the Connecticut Company, was commended for the position he took, when he announced that it was the desire of the company to act in accordance with the wishes of the community which the interurban serves. He further stated that economies effected by the discontinuance of the one line would result in improved service on the other—that of the surface lines so called.

Interesting Compilation Furnished Covering New Jersey Company

Robinson & Company, New York, N. Y., have compiled a fourteen-page booklet descriptive of the Public Service Corporation of New Jersey with particular reference to its common stock. A map showing the activities of the corporation in the railway, gas and electricity field is included. The data are complete with all details as to the corporation's management, field of operations, summary of securities, common stock dividend record and prospects, etc.

Some interesting statistics are given on the growth of the business since 1904. It is recorded that in 1904 the traction lines carried 165,400,000 revenue passengers, in 1910 258,746,130, and in 1921 348,284,712 revenue passengers were carried.

Financial News Notes

Loan for Extensions Hinted.—It is said that the Budget Committee of the Consul General of Paris, France, will issue a 400,000,000 franc loan ($80,000,000) for the extension of motor bus and electric railway lines in the suburbs of Paris.

New Company Will Take Over Railway.—The Mississippi Power Company has been chartered at Little Rock, Ark., to take over the railway and electric light company of Fort Smith, Ark. The capital stock is $1,700,000 and the officers are D. C. Green, president; George Sengel, Jr., vice-president; L. J. Noble, secretary, and R. D. Beard, treasurer.

New Issue Offered to Stockholders.—The stockholders of the Washington Water Power Company, Spokane, Wash., have been offered the right to subscribe to the extent of 10 per cent of their holdings to a new issue of stock. The amount of the new issue of capital stock is $1,549,000 and the proceeds will be used for capital expenditures already made or to be made this year. The regular quarterly dividend has been declared payable July 15 and all of the stockholders of the company using their subscription rights on or before June 20 will be entitled to the quarterly dividend on their additional holdings.

Capital Stock to Be Increased.—The stockholders of Tampa (Fla.) Electric Company have voted to increase the capital stock of the company from $2,879,800 to $3,454,800. Each stockholder of record on May 5, 1922, is offered the right to subscribe at $100 per share for one-fifth of a share of new capital stock for each share of capital stock standing in his name on the books of company at close of business on that date. Payment for stock subscribed for must be made in full at $100 per share on or before June 1, 1922, or at the option of the subscriber in two installments, $50 per share on June 1, 1922, $50 per share on Nov. 16, 1922.

Reorganization Plan Modified.—The plan for the reorganization of the San Francisco-Oakland Terminal Railways, San Francisco, Cal., has been modified by the reorganization committee and if approved by security holders will become operative thirty days after acceptance. The modified plan provides for elimination of tide lands, refunding of Halsey notes by subsidiary of new company to be organized, refunding issue to mature in fifteen years; one share of new common stock will be offered for four shares of old preferred instead of one share of new common for two shares old preferred as in the original plan. A board of fifteen directors chosen from the different groups of security holders will be created and voting power will be placed in the hands of a trust, where it will remain lodged for a fixed time for the benefit of stockholders.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over, except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on street and interurban railways in the United States.

Traffic and Transportation

Lower Fare Discussed

Mayor-Elect of Seattle Favors Reduction in Fare—Ways of Accomplishing Change Paramount in City Affairs

The first subject of discussion among city officials of Seattle, Wash., is that of a possible reduction in fares, the proposed fare to be 5 cents, if such a reduction is possible. The present fare on the lines of the Seattle (Wash.) Municipal Railway is 8⅓ cents, if tokens are purchased, or 10 cents cash, both fares having transfer privileges. In view of the fact that Mayor-elect B. J. Brown has announced that his first consideration after he assumes office on June 5, with a newly organized City Council, will be the reduction in fares and the expressed statement of every member of the City Council approving a return to the 5-cent fare in the city, the subject is bound to become paramount in city affairs.

CITY WANTS ADVICE

Corporation Counsel Walter F. Meier has been asked by Councilman-elect E. L Blaine for an opinion on some of the possible legal consequences should a lowered fare be undertaken, and Mr. Meier, in his opinion, declares that reduction in costs of maintenance and operation is the only way open to reduce car fare, which, he states, cannot be effected either at the expense of the bondholders or the taxpayers. In his opinion, Mr. Meier held that the railway contract does not admit of a foreclosure, but does admit of a receiver's sale in case of a proved violation. This would not revive the franchise formerly held by the Stone & Webster interest, except by consent of the City Council.

Mayor Hugh N. Caldwell, a former corporation counsel of the city, asserts that the fare reduction can come only through revision of the contract with the Stone & Webster interest.

The Mayor said the situation would eventually result in the contract revision on more equitable terms, the turning back of the system to the original owners, or the appointment of a receiver to handle the railway's affairs. The Mayor advocated a return to the jitney bus transportation in competition with the railway, which he said would help to bring the bondholders to terms, and urged that no steps be taken to exceed the letter of the contract, and that no more be done to solve the railway's problems "more than is absolutely necessary under the contract."

In the meantime, Councilman C. B. Fitzgerald has announced his intention of introducing at the first meeting of the new Council a fare-reduction bill, providing for a straight 5-cent fare on all lines, and that the matter of a charge for transfers and the installation of economies which will make the reduced fare possible will be left to the railway department and the Mayor as administrative officials.

In the meantime, D. W. Henderson, superintendent of the municipal railways, is working out plans for every possible reduction in the operating costs of the railway. Along this line, he is endeavoring to increase the number of one-man cars on the railway lines to effect further savings. As an experiment in the conversion of old equipment to conform to the one-man car plan, Mr. Henderson has just had one of the single-end cars made over into a one-man car. The street railway has twenty-seven cars of the type remodeled, and if it proves satisfactory, the other twenty-six will be remodeled. This will increase the number of one-man cars, which now number 30 per cent of the equipment, according to Mr. Henderson. As a method of reducing operating costs, Mr. Henderson has made the statement that he prefers the plan of increasing one-man cars to that of reducing salaries of the railway operatives any further.

Talk of Fare Compromise in Louisville

Ever since the United States Circuit Court of Appeals handed down its decision sustaining the injunction granted by Judge Evans, restraining city officials from interfering with the Louisville (Ky.) Railway in collecting a 7-cent fare, there has been talk of a compromise. According to Clayton B. Blakey, city attorney, the next move in the case rests with Judge Evans, unless a compromise is agreed upon.

Procedure in the case in the absence of a compromise, according to Mr. Blakey, will be to try it out on its merits, which will involve the taking of testimony as to valuation of property, income and expense.

Mayor Quin is reported to have said that he would consider a compromise of 6-cent fare should one be offered by the company. He said also that any other offer or suggestion made by the railway regarding a settlement of the case would receive consideration.

Commission Dismisses Suit

As a result of the Knoxville Railway & Light Company and the city of Knoxville, Tenn., filing a petition with the State Railroad & Public Utilities Commission asking that their appeal to the Supreme Court be dismissed, the fare in Knoxville will remain at 6 cents. This step ends a long controversy which has been raging since early last year, when the Knoxville Railway petitioned for a 7-cent fare with 2 cents additional as a transfer charge. The commission at that time ordered an appraisal of the property upon which it allowed an increase in fare from 5 cents to 6 cents. The city was opposed to the higher fare order. The decision of the commission was reviewed at length in the ELECTRIC RAILWAY JOURNAL, issue of July 9, 1921.

Electric Railways Excluded

Interstate Commerce Commission Holds No Reduction in Charges of These Companies Is Warranted

Reductions equivalent to 10 per cent on all freight rates were ordered in an opinion handed down by the Interstate Commerce Commission on May 24. The commission found:

1. That on and after March 1, 1922, a fair return upon the aggregate value of the railway property of the carriers defined in Section 15A of the interstate commerce act, determined as therein provided, will be 5.75 per cent of such aggregate property value, as a uniform percentage for all rate groups, or territories designated by this commission.
2. That the existing freight rates and charges including charges for switching and other accessorial services and all other charges applicable to freight service, which were increased by authority of "Increased rates 1920, *supra*," will be on and after July 1, 1922, unjust and unreasonable to the extent that they may respectively include more than the following percentage of increase over the rates in effect immediately prior to Aug. 26, 1920, in and between the various rate groups as defined in "Increased Rates 1920, 58 I. C. C. 220, 489," and "Authority to increase rates, 302."

In the Eastern group, also between points in Illinois territory and between Illinois territory and the Eastern group, 26 per cent instead of the 40 per cent authorized in the decisions last cited.

In the Western group, and between the Western group and Illinois territory, 21.5 per cent instead of the 35 per cent so authorized.

In the Southern and Mountain-Pacific groups, 12.5 per cent instead of the 25 per cent so authorized.

On interterritorial traffic, except as otherwise provided herein, 20 per cent instead of the 33⅓ per cent.

The opinion carries the following reference to electric railroads:

The only evidence as to the rates, fares and charges of electric railroads was introduced in behalf of a national association of such carriers. This was substantially to the effect that most electric lines do not fall within the view of section 15A of the interstate commerce act; that while generally their freight rates and charges were increased pursuant to increased rates, 1920 *supra*, the authority thereby granted did not extend to passenger fares, and that no reduction in their charges is warranted at this time. This evidence stands uncontroverted upon the record.

In the case cited, we said at page 253: "Petitions have been filed in this proceeding by a national organization of electric lines, seeking permission to increase their rates in the same proportion as the rates of trunk lines are advanced. The operating costs of these lines have, on the whole, increased in approximately the same ratio as those of steam railroads. In some instances, there is competition between the electric lines and the steam railroads. We conclude that the freight rates of electric lines may be increased by the same percentages as are approved herein for trunk lines in the same territory. This is not to be construed as an expression of disapproval of increases, made or proposed in the regular manner, in the passenger fares of electric lines."

Thereafter, many passenger fares were increased by electric lines in the same proportion as those of steam lines. On the whole, these carriers have had substantially the same relief as the steam carriers. The influences affecting their charges are much the same, and it would seem that they should receive like treatment. But the evidence is too meager to permit of specific findings as to individual electric lines, or electric lines as a whole.

Commission's Suggestions Adopted by Connecticut Company

"Our experience with the operation of buses has shown that this type of service cannot be operated at as low a cost per passenger as the trolleys, but where the condition of the track or public betterment projects makes necessary a large expenditure for track renewal on non-paying lines, it is quite possible that such substitution may be a means of retaining a measure of service that would not be warranted under other conditions." These statements are contained in a letter written by Lucius S. Storrs, president of the Connecticut Company, to the Public Utilities Commission, in reply to the commission's recent ruling concerning passenger rates in Connecticut and the suggestion that motor buses be used where trolleys have never paid and are unlikely to pay.

The commission at that time informed the company that the present rates of fare, except in the test case areas, would be permitted to stand despite a number of petitions for fare reduction from various parts of the State. The commission, however, called attention to the fact that it reserved jurisdiction over the pending cases and would decide later whether the present fare rates would bear changing.

President Storrs replied that the commission's suggestions for modification of present tests has been given careful consideration by the directors.

"A careful survey of the property will be made to determine the possibility of such substitution," he said concerning the suggestion to establish increased motor bus transportation on non-paying lines.

"It is our opinion that the ultimate interests of the communities and the company can be best served if the same rate of fare is applied to the entire property.

"In Bridgeport the results of the test thus far conducted show conclusively that the present method is not providing as much revenue as was obtained during the period immediately prior to its inauguration and the receipts fall far short of meeting all items of the cost of service.

"We will accept your suggestion as to the modification in the Norwich test area."

Beginning May 21, metal tickets, obtainable at three for 25 cents, were acceptable in payment of fare on that part of the Bridgeport system where the initial payment has been 10 cents.

Houston Disputes Car Removal

A controversy has arisen in Houston, Texas, over the question of removing the cars from Main Street, as proposed by Mayor B. E. Holcombe and agreed to by the officials of the Houston Electric Company. Acting on this agreement, the traction company has built a double track line on Fannin Street, which parallels Main, and the cars that had formerly used Main Street are being rerouted on Fannin and other streets on which tracks already were built.

Merchants along Main Street divided on the question, one faction favoring the removal of the cars and the other opposing. Both sides have prepared petitions for presentation before the City Council. Already three car lines have been rerouted, leaving four lines still on Main Street. These lines are awaiting the completion of a single track one block long from Fannin to Capitol Avenue.

The new tracks have been laid by the Houston Electric Company at a cost of $125,000. It was agreed that the cars would be removed from Main Street for a period of one year as an experiment to determine if the patrons really wanted the change. The traction company agreed not to remove its tracks from Main Street during this test but to cover then with asphaltum, and at the end of a year, if the patrons wanted the cars back on Main Street, they would be put back without undue cost.

It now looks as if court action may be resorted to by one or the other faction.

Hearing on Equalization of Fares Held

Further hearing on application of the United Traction Company, Albany, N. Y., for equalization of its fares discloses that receipts exceed the estimate of the United Traction Company. Actual revenue from operation showed an increase of 17 per cent over the amount the company estimated it would receive from the operation of its lines during the first four months of this year, Davis L. Waters, auditor of the company, testified before the Public Service Commission at a hearing on the order of the commission for further testimony about finance held on May 19. The testimony is closed and a decision is expected soon. Chairman William A. Prendergast conducted the hearing. Expenses of the company over the period amounted to 8 per cent over the amount previously estimated.

It was brought out that, figured on a car-mile basis, the revenue in the Albany zone was 54 cents a mile, while the expense for actual operation was 36 cents. In the Troy zone the revenue was 42 cents and the expense 37 cents.

The company made application several months ago for an equalization of the fares charged in Albany and Troy. In the latter city 6 cents is charged, which also is the amount in Cohoes and Rensselaer. In Albany the rate is 8 cents.

Mr. Waters testified that the company would have to expend nearly $600,000 for new trackwork in Albany and Troy this year.

A. E. Reynolds, general manager of the company, testified that since the operation of one-man cars in Albany better service has been given the public. He also testified regarding the expense of operating the cars.

Free Transportation Largely Eliminated

Simultaneous with the taking over of the Detroit United Railway system by the Department of Street Railways, City of Detroit, an order was issued which eliminates a great part of the free transportation heretofore supplied in Detroit and commonly supplied by most companies. Henceforth in Detroit no one will be permitted to ride on a pass except conductors and operators in full uniform, police and firemen in full uniform, division supervising officials presenting instructor's badges and trackmen presenting trackmen's badges. Any employee whose work requires that he get out on the property will be provided transportation from his office to that point and return, but he must pay his fare when riding from home to work or at any time when not actually on company business.

All motormen of both one-man and two-man cars are henceforth to be called "operators," according to a recent order of the department.

Another change made in the organization of the municipal railway system in Detroit was the abolishment of the position of night superintendent of city lines. Under the municipal operation, each division superintendent will be responsible for operation of cars on his various lines and for the conduct of the personnel of night forces as well as day forces.

Lower Fare to Become Effective June 1

Instead of reducing its fare to 6 cents as of July 1 as arranged in the new franchise the Washington Water Power Company and the Spokane City Railways filed a new tariff with the State Department of Public Works which calls for a 7-cent cash fare and a 6-cent ticket fare to become effective on June 1. E. V. Kuykendall, director of the State Department of Public Works, stated that the department would waive the thirty-day period which must usually elapse before the filing of a new tariff and its going into effect. The universal transfer will not, however, become operative until July 1, when the consolidation of the two properties takes place.

General Manager Connors of the Spokane City Railways expressed his approval of the earlier date for the lower fare schedule. On this point he said:

> It will give our riders an opportunity to get accustomed to the new plan. I can see a bright future in store for the Spokane United Railways after consolidation and I am therefore more than pleased to help push the good work along by giving the people the benefit of the fare reduction sooner than they expected.

Preparing for One-Man Cars.—The Olean, Bradford & Salamanca Railway is preparing for operation of one-man cars in the city of Olean, N. Y. It expects to put its first car of this type into service in ten days and others will soon follow. Cars are now being reconverted for one-man operation.

Interurban Service Extended Through Chicago

Since Feb. 15, 1922, the Chicago North Shore & Milwaukee Railroad has been operating its Milwaukee limited trains through the loop to Sixty-third Street and Woodlawn Avenue on the south side, providing an hourly service for south side business men and residents to and from Milwaukee and intervening cities. Similarly, the merchandise dispatch service of the company was extended from the loop south and receiving stations located at Sixty-third Street and Calumet Avenue and Forty-first Street and Union Avenue at the Union Stockyards. This extension of the services of the company over the elevated structure to the south side of the city gives this section the same high grade service that is afforded to passengers boarding and leaving the trains in the loop or at north side stations.

The extension of the service adds about twenty-five minutes to the running time of each limited train, but inasmuch as there was formerly a layover for each limited of fifty-five minutes, it was possible to extend the service with but little additional cost.

As a result patronage of the through service to the south side is increasing steadily and it is felt by the officers of the company that in time it will add substantially to the patronage of the North Shore Line. It makes the railroad more useful to the community and tends to create new habits of travel, because of the convenience, which will bring much of the travel on the part of the south side people to cities north of Chicago to the North Shore Line.

While the elevated railroad gives a good service from the south side to the Loop, where the main Chicago terminal of the line has been heretofore, the North Shore trains give a de luxe non-stop service for which the passengers are willing to pay a higher rate of fare. The city is divided into three zones, so that it costs only 11 cents more for a Milwaukee passenger to ride clear through to the south side than it does to come only into Wilson Avenue on the north side. The straight mileage rate does not apply after the train reaches the elevated system in the city.

Fare Reduction Ordinance Repealed

The City Council of Little Rock, Ark., has repealed the ordinance requiring the Little Rock Railway & Electric Company to reduce its fares from 6 to 5 cents. One Alderman explained that the ordinance was ineffective because of the failure of the Council to give the company the necessary thirty-day notice, as required by law. The repeal of the ordinance, it is said, was requested by the attorneys having in charge for the city the public utility rate cases that are pending in the courts. A resolution was introduced by the public utilities committee notifying the railway that a hearing would be held in the Council chamber on the evening of June 26 to determine what will be a fair and reasonable charge for carrying passengers, and, providing the facts and evidence at the hearing justify, the rate charged will be reduced. The resolution was adopted.

Transportation News Notes

One-Man Cars Appear.—The Philadelphia (Pa.) Rapid Transit Company recently started the operation of one-man cars on the Jefferson and Master Streets divisions.

Will Contract for Tokens.—Joseph S. Goodwin, general manager of the Detroit (Mich.) Municipal Railway, has received authority to contract for 500,000 metal tokens to facilitate fare handling.

Five-Cent Fares to Continue.—The Lake Shore Electric Railway, Cleveland, Ohio, has abandoned its fight for higher fares at Sandusky. This means 5-cent fares will continue, six tickets for a quarter and free transfers.

Warning Autoists.—The police of Trenton, N. J., are distributing circulars to autoists warning them to be careful when pulling from a curb to prevent being struck by a trolley car. The majority of the trolley-auto crashes are due to careless autoists.

An "Exciter" Comes from Pine Bluff.—The Pine Bluff (Ark.) Company, in conjunction with the Arkansas Light & Power Company, recently began publishing a small weekly house organ, called the "Exciter." The little magazine contains personal and other items. It is edited by A. G. Whidden, in charge of publicity for the companies.

$1.25 Weekly Pass for Fort Smith.—The Fort Smith Light & Traction Company has received permission from the Arkansas Railroad Commission to increase as of May 29, its cash fare from 6 to 7 cents and to install a weekly pass at $1.25. The latter will be of the transferable, unlimited-ride type now in use at Racine and Kenosha, Wis.; Youngstown, Ohio; New Brighton and Meadville, Pa.; Fort Wayne and Terre Haute, Ind.

Rewards Offered for Service Suggestions.—To encourage trainmen in making suggestions for the betterment of service, the Los Angeles (Cal.) Railway has announced that monthly cash prizes will be given for the best ideas. Only trainmen engaged in actual operation of cars will be allowed to participate. For the best suggestion in any calendar month, $7.50 will be given, $5 for the second best and $2.50 for the third best. The plan was put in effect May 1.

City Appeals from Ruling.—An appeal was filed recently by the City Solicitor of Scranton, Pa., against the ruling of the Public Service Commission continuing the 8-cent fare on the lines of the Scranton Railway for another six months. The city contends that the commission acted without serving proper notice upon the city and the public. The appeal was filed in the Superior Court of Allentown and the first Monday in October was set by Judge Trexlen as the day for hearing the argument.

Will Increase One-Man Cars.—So satisfactory has the one-man car system proved on a number of lines of the Springfield (Mass.) Street Railway that it is planned to add a number of lines to the one-man car list this season. Preparatory to this extension between twenty and thirty cars of the double-truck type are being made over into one-man cars, as these cars have the preference over the small one-man cars, first introduced. At present there are three day lines and three all-night lines operating in Springfield on the one-man basis. All the company's Westfield lines, except those running between Westfield and Springfield, have the one-man car service.

Uncertain Outlook Emphasized.—In a conference with the executive committee of the Holyoke Chamber of Commerce, on May 15, relative to a suggestion that the Holyoke (Mass.) Street Railway reduce its rates or extend its zone limits, President Louis D. Pellissier said that he deemed any reduction at this time as ill-advised. He said that while the company last year paid a dividend of approximately 6 per cent on the par value of the stock, the average price paid by the stockholder was $120 a share, so that the dividend really amounted to only 5 per cent. He explained that the total revenues in 1921 were $11,000 less than in 1920 and the passenger revenues $28,000 less, while the outlook for the future was uncertain.

Freight Rights Granted.—The town board of Port Fulton, Ind., in the southern part of the State, has adopted an ordinance granting the Interstate Public Service Company an amended franchise for the use of the streets of the town by removing the restriction on hauling freight, which under the old franchise might be handled only between the hours of 8 p.m. and 6 a.m. The removal of the restrictions is in order to aid the building of rail-river terminals in which the Interstate will co-operate with the Inland Waterways Company, which will handle the water end of the traffic while the Interstate will handle the rail end. The Interstate will give connections to freight hauled either by steam or electric road and the branch to be laid to make the necessary connection will be considerably less than a mile long. The companies have options and will buy the land on which the Ohio River terminals will be built.

Personal Mention

Canadian Officers Prepare for Meeting

G. Gordon Gale, Thomas Ahearn, George Kidd, F. D. Burpee and Arthur Gaboury Are Hosts for Canadian Electric Railway Association

AGAINST the background of the Canadian Electric Railway Association five men stand out as does the aurora borealis against the Canadian sky. These five men—G. Gordon Gale, Thomas Ahearn, George Kidd, F. D. Burpee, and A. Gaboury—will guide the meeting of the association in Quebec on June 1, 2 and 3, and cram into those three days a variety of important railway matters. The brilliance of display will be apparent then—the evidence of months of painstaking planning.

MR. GALE LEADS

G. Gordon Gale, president of the Canadian Electric Railway Association, will act as chief master of ceremonies. Mr. Gale is vice-president and general manager of the Hull (Que.) Electric Company, as every one in the industry knows. His promotions read like steady steps leading to his present post of responsibility and honor, for the notices say: "Mr. G. Gordon Gale appointed acting general superintendent of the Hull Electric Company; Mr. Gale appointed general superintendent of the Hull Electric Company; Mr. Gale appointed manager; Mr. Gale appointed vice-president." And most of this time Mr. Gale has been chief engineer of the company at Hull. Those changes are logical, and they sound easy. They were for Mr. Gale, else he would never be where he is when he is. His association with the Hull Electric Company began in 1907. Before that, Mr. Gale was assistant engineer of the electrical plant of the Canadian Rubber Company. He is a graduate of the electrical engineering department of McGill University.

Mr. Burpee, vice-president of the association, is manager and director of the Ottawa Electric Railway, and director of the Ottawa Traction Company. He joined the company in 1893 and five years later became assistant to the superintendent and secretary-treasurer. In 1912 he took over the duties of superintendent, and held that position, with the exception of the war period, until 1920. In that year he was appointed general manager.

In the post of treasurer is Arthur Gaboury, superintendent of the Montreal Tramways. His work in railway associations has been active and extensive. In 1919 he was elected president of the Canadian Association, and during that year he served on the executive committee of the American Electric Railway Transportation & Traffic Association. Mr. Gaboury began as conductor and motorman with the Montreal Street Railway, gaining there pointers on the practical side of transportation. He was successively assistant inspector in traffic handling, chief clerk at the St. Denis Street carhouse, claim agent, and assistant superintendent. In 1907 he was appointed superintendent.

MR. AHEARN A PIONEER

Mr. Ahearn, who is honorary president of the association, is known everywhere as the president of the Ottawa Electric Railway, and one of the leaders in the construction of that railway, which was the first in Canada. Building a railroad is far simpler than making it run, and run successfully. Mr. Ahearn did both, and thereby solved the problem of operating an electric service on wheels throughout the Canadian winter. For many years Mr. Ahearn was active in the construction of electric works, and was vice-president of Ahearn & Soper, Ltd., electrical engineers and contractors. Shortly after entering business, Mr. Ahearn was manager of the Bell Telephone Company at Ottawa.

George Kidd, general manager of the British Columbia Electric Railway, is serving once more as honorary vice-president of the Canadian Electric Railway Association. He was trained in accountancy and accepted a post with Mellors, Basden & Mellors, chartered accountants, Nottingham, England. In 1907 he was appointed secretary of the British Columbia Electric Railway, with his office in London, England. In 1911 he was made comptroller of the company and removed to Vancouver, B. C., and in May, 1914, received the appointment of general manager of the company, which position he now holds. The British Columbia Electric Railway represents an investment of $60,000,000 in and around Vancouver and Victoria, controlling the electric railway, light, power and gas systems in these centers.

T. AHEARN G. KIDD G. G. GALE F. D. BURPEE A. GABOURY

One of the most recent accomplishments of Mr. Kidd was the acquisition of the Western Power Company of Canada, which system has now been amalgamated with the mainland system of the British Columbia Electric Railway. A $10,000,000 water power development scheme is being planned on Stavex Lake, where the Western Power Company's present generating plant is situated.

Major Henry Mattison, chief civil engineer for the Manchester (England) Corporation Tramways, has been appointed general manager of the undertaking, in succession to J. M. McElroy, retired through ill health. Mr. Mattinson has been connected with the Manchester tramways for twenty-one years and has been chiefly responsible for the construction of almost the whole of the present 220 miles of single track. During the war he carried out much railway construction and reconstruction work in Syria.

G. D. Baker—Owner and President

New Leader of Springfield & Washington Railway Co-operates With Bus Line in Restoration Plans

George D. Baker, who recently was elected president of the Springfield & Washington Railway, South Charleston, Ohio, after purchasing the road from the other heirs of his father, George W. Baker, is known as one of the liveliest business men in central Ohio. In addition to his traction interests, he is also owner of a railroad tie producing business. Its extent may be realized when it is known that he but recently installed a $200,000 plant in Washington Courthouse for the chemical treating of ties to preserve their life.

Takes Over Line

Mr. Baker took over the Springfield & Washington line shortly after application had been made by the former owners to the Public Utilities Commission to discontinue the road because of poor business and loss of revenue. The line operates between Springfield and South Charleston. Originally, it was intended to extend the line from Springfield to Portsmouth, but when the tracks were laid to South Charleston the backers ran out of funds and the company halted its extension efforts.

Mr. Baker took the line over in the belief that through proper management and reduction of operating expense the properties could be made a paying investment, and traction men in the middle West are watching his moves with extreme interest in the belief that some of his ideas may be applicable to their own lines.

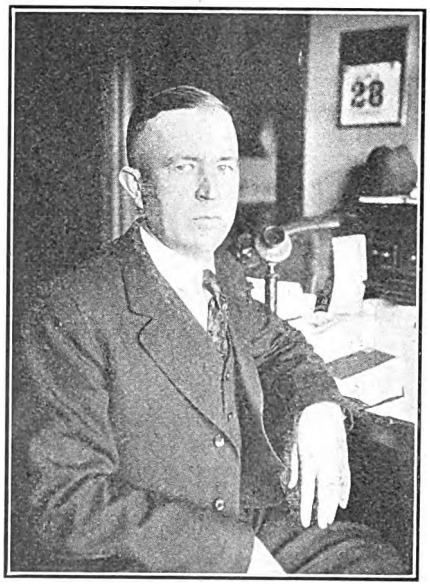
One of the first steps taken by the new owner of the line was to perfect an agreement with the Flag bus line, which had been operating buses between Springfield and Washington Courthouse, whereby the buses were to be operated between South Charleston and Washington Courthouse only, thereby serving as a feeder for the traction line. In return, a through rate agreement was made so that Springfield passengers would make the trip from South Charleston to Washington Courthouse via the bus line.

Plans to Install Additional Bus Lines as Feeders

Within the next few weeks other bus lines, owned by the traction line, will begin operating from various points to connect with the road and serve as additional feeders. Another step planned is the removal of the Springfield station to a point where the rental will not be so high. Night carrying of freight in order to make the traffic carry through twenty-four hours a day is also contemplated. Mr. Baker also has a number of other ideas "up his sleeve," but these he declines to reveal until he has been given an opportunity to test their soundness.

Construction of the Springfield & Washington Railway was started originally by a company known as the Springfield, Charleston, Washington & Chillicothe Railway. George W. Baker, father of the present owner of the line, was at that time in the tie business at Washington Courthouse and furnished most of the ties for the line. He became one of the heaviest creditors, and when the road failed some time later, he took over the properties and organized it as the Springfield & Washington Railways. When the father died in 1914, the son, George D. Baker, took over the tie business and the road was operated by the other heirs, with Floyd Baker as general manager. The road began to show deficits in 1921 and early this year an application was filed with the State to discontinue the line. It was then that Mr. Baker stepped in and purchased the company and reorganized its affairs.

The new officers of the company are: George D. Baker, president; W. W. Keifer, vice-president; W. F. Gangwish, secretary, and C. J. Baughn, treasurer.



G. D. Baker

The new owner has secured the co-operation of the Chamber of Commerce in Springfield and Washington Courthouse and these organizations have pledged themselves to assist in every way toward making the road a financial success. Those who are acquainted with Mr. Baker, however, say that developments will show him to be making most of the suggestions and doing the real work of placing the road on its feet. It is easy to see that Mr. Baker has established a reputation for progressiveness and that he will hold it in his new work.

M. F. Ryan, who has been with the Philadelphia (Pa.) Rapid Transit Company for fifty years, was honor guest at a banquet in celebration of his long service. He was a conductor for some time, and later was made superintendent of surface lines.

Obituary

John Q. Ross

John Q. Ross, a member of the board of directors and for several years president of the Muskegon Traction & Lighting Company, died at his home in Muskegon, Mich., on May 12. Mr. Ross was only forty-eight years old. He was very prominent in his home state, where for two terms he served as Lieutenant-Governor.

Mr. Ross played an important part in the life of the Muskegon Traction & Lighting Company during the last few years. He brought about a reorganization of the local management of the company two years ago, with the result that the American Light & Traction Company, the parent company, placed George Steinwedel in charge as president and general manager at Muskegon. Mr. Steinwedel shortly afterward reorganized the entire personnel of the company. Mr. Ross then resigned as president, but continued as a director.

Mr. Ross was a lawyer, but quit active law practice a few years ago to look after his industrial interests. He was president or a director of more than a score of Muskegon industries.

John F. Stephens, member of the board of trustees of the Boston (Mass.) Elevated Railway, died in Roxbury, Mass., May 11.

Charles J. Smith, division superintendent of the Dorr carhouse of the Community Traction Company, Toledo, Ohio, died May 20. He started as a conductor with the company twenty-five years ago.

Frederick G. Wisell, chief draftsman in the engineering department in Seattle, Wash., of the Puget Sound Power & Light Company, died April 22. He did some work for the company at Snoqualmie Falls in 1907, and later that year became a draftsman in the Seattle office. In 1914 he was transferred to the engineering department, and two years later, when the engineering forces of the company were consolidated, he was made chief draftsman.

Clayton E. Dutot, timetable maker for the New York Consolidated Railroad, which operates the subway and elevated lines of the Brooklyn Rapid Transit system, died at his home in Brooklyn, on May 10. He had been with the Brooklyn Rapid Transit Company for more than twenty-one years and was an expert in the making of schedules and run sheets. Mr. Dutot entered the employ of the Brooklyn Rapid Transit Company as agent and operator. He was made train clerk in 1903. The following year he was promoted to the position of dispatcher, and in 1908 was assigned to the timetable department, where he remained up to the time of his death.

$300,000 for Power Improvements

Five New Automatic Substations Are Included in Program of United Railways, St. Louis

Contracts have just been let for five new automatic substations in St. Louis. Owing to the increased number of cars operated, the receiver of the United Railways found it necessary to increase materially the power facilities of the system. At the present time more cars are being operated than ever before—about 1,360 at the peak hours—resulting in an overload on the present facilities, both transmission and converting equipment. As the majority of the power used is purchased power, principally from Keokuk Dam on the Mississippi River, the question resolved itself into additional transmission and converting equipment.

A contract has just been entered into for the purchase of four 1,000 kw. converters with the necessary automatic control equipment for two 2,000 kw. units at present on hand which will be moved from existing stations to new buildings. Requiring additional equipment on two of its County Lines, the company purchased apparatus of the automatic type and the experience with this equipment, together with the experience with other companies, led to the adoption of automatic apparatus for the new city stations as follows:

One 1,000 kw. station at Union and Maple Avenues (western portion of the city); one 2,000 kw. (two 1,000 kw. units) station at Taylor and Fairfax (central western portion of the city); one 2,000 kw. station at 7th and Franklin (downtown district); one 1,000 kw. unit at Broadway and Arsenal Street (eastern and semi-southern portion of the city).

The total approximate cost of the new substations will be $300,000, against which there will be a credit applicable on account of copper removed of from $25,000 to $40,000, depending upon the amount of copper it is finally decided can be dispensed with and the scrap value of copper at the time. The gross figure of $300,000 is divided approximately as follows: electrical equipment, installed, $185,000; transmission and distribution (practically all transmission), $60,000; land and buildings, $55,000.

Southern Pacific Lines Establish Tie-Treating Plant at Los Angeles Harbor

The Southern Pacific Lines have just completed and placed in operation at Los Angeles Harbor a new tie-treating plant, which provides for the employment of 100 men at the start. The new plant is under the management of Frank D. Mattos, and will handle and treat approximately 750,000 railroad ties a year. Green ties will be brought to the plant at Los Angeles Harbor via ships from the tie-producing points at northern locations on the Pacific Coast, and will be treated under the railroad's own process, namely, Rueping, before being placed in service. Douglas fir lumber is the type of tie treated under this process. Tie requirements of the Southern Pacific Lines are in the neighborhood of 3,000,000 ties a year. This process renders the ties serviceable for from fifteen to twenty years. This new plant is one of three controlled and operated by the railroad.

The Coal Situation

Prices of coal advanced last week an average of 51 cents. The volume of free coal is restricted, as the large non-union shippers are committed on their May output. Those who have coal for sale are the ones who are following a policy of getting the top of the market, selling from day to day and at most from week to week.

Efforts at Washington to hold the price down have but little affected market quotations; they have really introduced a general hesitation that may be the forerunner of an easing of prices. The meeting of non-union operators in Washington on May 31 will bring out more fully the plans of the Secretary of Commerce and the opposition of any who have no faith in such procedure. It is recognized that distribution plays an important role in controlling prices, and in this the jobber, who now is speculator as well, is a factor. He is the key to distribution for the great majority of small producers.

In the Middle West pooling of buying by railroads and other large consumers is holding the market in check. Speculators found that much of the tonnage which they have shipped in on consignment was not readily taken and some low figures were taken to dispose of these cars. This steadying influence has been exerted in the face of a distinctly bullish market.

New England and the Northwestern markets remain comparatively quiet. In the former, stocks are heavy and although the supply has been shortened, consumers are not eager to buy at the ruling quotations. The rising prices have caused rehandlers in that section to be more cautious about commitments. The Northwest has been stirred only slightly by the unusual orders placed with the docks at the Head-on-the-Lakes for shipment to Lake Michigan points and to distant rail destinations. Lake dumpings proceed at the rate of 250,000 to 300,000 tons weekly but much of this coal is being shipped to other lower lake points. *Coal Age* index of spot prices of bituminous coal increased 42 points to 303 on May 22. Spot prices are now at their highest point since late in 1920.

Westinghouse Sales for the Year, $100,000,000

In spite of the extremely adverse conditions of the past year, the sales of the Westinghouse Electric & Manufacturing Company amounted to almost exactly $100,000,000, as shown by its annual report, as of March 31, 1922. This is the largest volume of business handled by this company except during the abnormally active previous three years. Manufacturing costs were high, however, as these could not be reduced as rapidly as prices fell. Furthermore, the expense of development work and about $1,500,000 for depreciation of inventory were charged against manufacturing costs, so that the increase in surplus was only slightly greater than the amount paid out in dividends.

The excellent "cash position" of the company is shown by the fact that its current assets—including cash, U. S. securities, and accounts and notes receivable—total $41,700,000, while its current liabilities—accounts payable, dividends unpaid, and accrued interests, etc.—are only $11,400,000. In addition, the company possesses an inventory of $55,000,000.

Chairman Guy E. Tripp says in his report: "The contraction in orders booked continued throughout the year until January, 1922, when there began a substantial improvement which has since been maintained. In addition to the favorable indications for an increasing demand for the regular lines of the company's products, a large demand for radio telephone receiving apparatus has recently developed with a prospect of its continuance for an indefinite period. It should be pointed out, however, that the ensuing year promises to be a period of keen competition."

The income account for the year is as follows:

Gross earnings	$99,722,026
Cost of sales	93,461,846
Net manufacturing profit	6,260,180
Other income	2,673,808
Gross income	8,933,988
Interest on bond and notes	3,096,600
Net income available for dividends, etc.	5,837,388

Metal, Coal and Material Prices

Metals—New York	May 23, 1922
Copper, electrolytic, cents per lb.	13.75
Copper wire base, cents per lb.	15.00
Lead, cents per lb.	5.56
Zinc, cents per lb.	5.50
Tin, Straits, cents per lb.	30.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.375
Somerset mine run, Boston, net tons	4.125
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	....
Central, Ill., screenings, Chicago, net tons	....
Kansas screenings, Kansas City, net tons	2.625
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.75
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	96.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	97.00

$8,000,000 for French Railway Electrification

The Locomotives and Esuipment to Be Furnished by French Representatives of International General Electric Company

The forward-looking policy of the French railroads in electrifying their main lines is evidenced by the recent definite action of the Paris-Orleans Railway, one of the six great systems of France. According to dispatches recently received, and as a part of the program for electrification with the 1,500-volt direct current system, selected after an exhaustive study of European and American experience, this railroad, which operates over 5,000 miles of route, has placed an $8,000,000 contract for eighty freight locomotives and eighty heavy high-speed passenger motor cars.

This equipment will be furnished by a group of French manufacturers headed by the Compagnie Francaise Thomson-Houston, representatives in France for the International General Electric Company. While the larger part of the order will be manufactured in France, considerable material of American manufacture, it is understood, will also be required.

The engines will be used on an extension of the original electrification made a quarter of a century ago by the French Thomson-Houston Company with General Electric apparatus. The first part of the new 1,500-volt section will cover 125 miles of dense main line traffic between Paris and Vierzon. The motor cars will replace and extend the present suburban steam service out of Paris.

The high-speed through-passenger service from Paris to Vierzon on the way to southern France will be served by 1,500-volt, direct-current electric locomotives weighing 250,000 lb. each and capable of regular running speeds between 80 and 85 miles per hour. While these machines are not included in the contracts thus far awarded, the railway company is expected to announce the placing of this business at an early date and to give consideration soon to the purchase of large numbers of additional locomotives for use on the 2,000 miles of its system in the central plateau region.

Rolling Stock

Long Island Railroad, New York, N. Y., has filed for approval with the Interstate Commerce Commission a certificate issue of $980,000 to enable it to secure forty steel motor passenger cars.

United Railways, St. Louis, Mo., has ordered fifty equipments from the Westinghouse Electric & Manufacturing Company for the cars now under construction in the railway company's shops. The motors will be type 510-A, 35 hp., 600 volt, the control will be single end K-35-HH, with a Westinghouse type 801-E line switch used in conjunction with pneumatic door engines and door-interlocking equipments.

Track and Roadway

Department of Street Railways, Detroit, Mich., will probably rebuild 12 to 15 miles of double track overhead this summer.

Public Service Railway, Newark, N.J., has removed the tracks from along the curb line and placed them in the center of the streets at Woodbury, N. J.

Gary (Ind.) Street Railway will use Dayton resilient ties in the reconstruction work on Broadway from the Wabash Railroad to the north terminus at the steel mill gates. This improvement was referred to in the ELECTRIC RAILWAY JOURNAL, issue of May 20.

Petaluma & Santa Rosa Railroad, Petaluma, Cal., has been granted permission by the State Railroad Commission to construct eleven grade crossings for a spur track across Washington, Water, and First Streets and B, C, D, E, F, G and H Streets and Second Street in the City of Petaluma.

Pacific Northwest Traction Company, Everett, Wash., H. B. Sewall, manager, announces that an expenditure of $250,000 will be made on the interurban line running between Bellingham and towns in Skagit County. The work proposed will include the replacing of several bridges, and four and one-half miles of trestle decking.

Shops and Buildings

Georgia Railway & Power Company, Atlanta, Ga., expects to build one new carhouse.

Department of Street Railways, Detroit, Mich., will build a new shop building 275 x 237 ft. in the immediate future for use as a paint shop and shop office and stores building.

Hagerstown & Frederick Railway, Hagerstown, Md., has broken ground at the carhouse on Summit Avenue for a storage building 33 ft. x 63 ft. It will be one story and constructed of brick and tile, with concrete floor. It will be used by the company for storage of material for general repairs, such as wire, etc.

Boston (Mass.) Elevated Railway expects to be in the new inspection and repair shops being erected at Forest Hills on scheduled time. The building is two stories high, 65 x 450-ft. of brick and steel and will cost about $250,000. When the structure is complete the company will have a modern repair shop.

New York, N. Y.—The Transit Commission has ordered that bids be received on June 2 for the construction of a temporary car shed at the Lenox Avenue shops of the Interborough Rapid Transit Company on 147th Street and for storage tracks in the 180th Street yard. These sheds are to house 350 new subway cars, 100 of which are to be ordered immediately.

Trade Notes

Galena-Signal Oil Company, Detroit, Mich., announces the removal of its Detroit office from Room 2203 Dime Bank Building to Room 2214.

Fiber Conduit Company, Orangeburg, N. Y., has acquired the plant of the American Fiber Conduit Corporation at Fulton, N. Y., and the conduit manufacturing business of the Johns-Manville Company at Lockport, N. Y., and has appointed Johns-Manville Inc., as sales agent for its products, effective as of May 15, 1922.

Johns-Manville, Inc.-The Johns-Pratt Company have mutually decided to manufacture and market their respective products separately. For many years Johns-Manville, Inc., has acted as exclusive selling agents for the various products manufactured by the Johns-Pratt Company, of Hartford, Conn. Both parties feel that now they can serve the trade more effectively and economically by concentrating on their own lines. The change will become effective on June 15.

Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., has received from the Municipal Railways of San Francisco an order for twenty double equipments of 532-A motors and double-end K-36 JR control. Each equipment will also include an 806-D line switch. This order represents the first application of 532-A motors to Brill Radiax trucks. Helical gears are to be furnished on the motors. The municipal lines of San Francisco have had in service for approximately one year one trial equipment similar to those recently ordered.

New Advertising Literature

English Electric Company, Ltd., London, England, has just issued new publications Nos. 330, 331, 332, and 336. These give information regarding cylindrical balanced valves, electric relief valves, electric bucket attachment for impulse wheels, and the Fullagar oil engine.

Miller Trolley Shoe Company, Boston, Mass., has just issued a twenty-two-page catalog descriptive of its trolley shoes. Illustrations of cars and trains for many of the electric railways using this equipment are given, together with information on the operation of the shoe as a current-collecting device.

Canadian Car & Foundry Company, Ltd., and its subsidiary, the Canadian Steel Foundries, Ltd., of Montreal, have issued bulletins Nos. 42 and 43 giving description of cars built for the Toronto Transportation Commission. This company built the 140 steel frame motor cars and sixty steel frame trailers recently put in service by the Toronto Transportation Commission. A large amount of manganese special trackwork used in the rehabilitation of the Toronto system was also supplied by this company.

Volume 59 — New York, Saturday, June 3, 1922 — *Number* 22

Philadelphia Must Have a New Deal

PHILADELPHIA appears to have reached the end of its traction rope. President Mitten frankly says so, and expert Feustel for the city virtually admits as much. Mr. Mitten's plea is for the entrance of the city as a real partner of the company in planning for the future. Mr. Feustel sees an arrangement of this kind as the only way out if transit facilities are to be increased in keeping with the growth of the city.

On the whole the conditions of the proposal made by Mr. Mitten are not unlike, in their object, the end which the New York Transit Commission is seeking to reach. The need is imperative in both cities for planning for the future. In Philadelphia, however, the way would seem to be easier to accomplish the desired end, for in that city there are not the besetting political complications which exist in New York in the shape of a hostile city administration whose policy is one of obstruction with respect to the building of new lines, although much progress has been made in New York recently between the companies and the state-created commission toward a basis of understanding so far as the existing systems are concerned. One thing Mr. Mitten has done in his statement that should redound to the benefit of the entire industry—he has helped to drive home the lesson of the extent to which the real estate owners and speculators have profited through rapid transit expansion. The land values thus created have enriched the real estate dealers and owners, but made the railways poor indeed.

There Is Still Time in Louisville

HOPE seems to have gone a-glimmering for the orderly settlement out of court of the question of the fare to be charged by the Louisville Railway. At least the filing of a petition with the court on the part of the city in the case recently decided against it in the controversy with the company would indicate this to be the fact, although President Barnes is doing everything in his power to bring about a settlement without further litigation. It is not a case of peace at any price with the company. As a matter of fact, as things now stand the Louisville Railway would appear in the long run to have most to gain by insisting upon its legal rights.

The proposal from Mr. Barnes is for a sliding scale of fare. The tendency with the representatives of the city as with many others is to picture such a proposal from only one angle, the angle of the fare sliding up. Louisville people should stop to consider that even without any such settlement arrangement as is now being suggested the fare did slide up to 7 cents. The fact is that Mr. Barnes has the future of the city as firmly in mind in his proposal as he has that of his own company. Like many other managers, he has learned that there is little magic in the so-called unalterable fare whether it be 5 cents, 6 cents or 7 cents. There can be only one criterion as regards fares. It is that the rate shall be such as to insure economical and efficient service, afford the employees fair wages and working conditions and protect the rights of the investors. A fixed rate is incompatible with any such ideals as these.

The litigation so far carried on in Louisville has been costly. It is being reflected in the increased fare which residents of that city are now paying. The sensible thing for the city of Louisville to do would be to forget litigation and get together with the railway on the basis of some such settlement as President Barnes has suggested—a settlement that will restore the credit of the company and make possible the raising of $1,000,000 or more for the purpose of extending and improving the existing lines.

Solving the Problem of Interurban Bus Competition

O. HENRY had a character, one Jeff Peters, who had to be reminded. Whenever he was called upon, pointedly, for a story, he would maintain that his life had been as devoid of incident as the longest of Trollope's novels. When lured, however, he would grow garrulous. It sometimes seems that electric railway managers are less responsive in having their latent abilities awakened than was Jeff in reacting to stimulating suggestion. But when aroused these railway men can accomplish wonders.

Recently in Lexington, Ky., cerebral activity was quickened by the keenly felt competition of the bus. What did a little inquisitive probing show? It revealed that the replacement of 76,000-lb. two-man interurbans with one-man cars one-third as heavy would net operating economies sufficient to pay a substantial return on the increased investment. With such a financial assurance, ten 25,000-lb. cars were ordered, in the design and equipment of which no feature or appliance was overlooked that would make people prefer them to the buses. Seats were made wide and comfortable. The interior of the car was made to appear roomy and attractive by the absence of all unsightly devices. The fare collection method and the step and platform design are such as to inconvenience the passenger the least possible. The advent of these cars was accompanied by a 50 per cent increase in service and a decrease in the fare.

Two months later. Buses gone. Increased traffic and cars popular. Power demand of combined city and interurban load has fallen off 15 per cent. Peak of interurban load alone is 50 per cent lower. Power house capacity released by leveling of load curve has a value equal to 80 per cent of the investment in the new cars. Moreover, it was possible to resell the re-

Digitized by Google

leased power capacity to meet an increased lighting load. Energy consumption on a car-mile basis is now one-half its former value. Provided the remaining 20 per cent of the car cost is met by the salvage value of some of the old equipment, the new capital required is zero dollars. When further economies of labor, track and car maintenance, power, etc., are now mentioned they connote profit.

In producing a unit to comply with the specifications laid down by the railway, the car manufacturer was not without his problems. To meet the conditions, a type of construction new to car design was applied. The use of a curved side with a reverse bend so that the sheet steel side acts as a girder is distinctly a development in the art. Although the frame design is the largest factor in reducing the car weight, aluminum was used to advantage in several places. Careful design also helped eliminate excess metal from the low-floor trucks of the arch-bar type. All in all, the fabrication of an interurban car weighing but 555 lb. per seat is indeed an accomplishment of considerable moment to the industry. It shows what the railway manager will ask for and what the car builder can produce when the exigency arises.

The car design, however, is but one phase of the general plan of applying merchandising principles to the complete revamping of the interurban service. Every consideration which would save time and trouble and make the service a pleasure as well as a necessity received the study which it deserved. Undoubtedly the riders, if asked why they prefer the present transportation facilities to any other, would answer speed, comfort, cheapness and frequency of service. Ask the manager for his explanation and he will go much deeper into the underlying reasons, the paramount of which, one discovers, is pleasing the public.

Success in Detroit Would Not Establish Success of M. O. Generally

COMPLETE municipalization of the street car service in Detroit, long expected, is now a fact. The methods and policies that have given a measure of respect for the accomplishments of the Department of Street Railways, as applied to the small system constructed by the city, are now extended to the entire local transportation facilities. To those who are confidently expecting this situation again to demonstrate the inherent fallacy of municipal ownership and operation, it should be said that their hopes are likely to be fruitless, for the true outlook is that there is more prospect of success than failure in Detroit.

The reasons for this go back to fundamentals. It should be recalled that a new city charter became effective in Detroit June 27, 1918. This put a completely new aspect on the conduct of the city's business and paved the way for a strictly businesslike handling of the street railway service, provision for which was incorporated in the new charter. By the new form of government forty-two Councilmen elected by wards on partisan tickets were replaced by nine Councilmen all elected at large on non-partisan tickets. On the former basis, the Council met once a week, affairs were carried on through twenty-six committees, each having a membership of seven, and Councilmen were paid a part time salary of $1,200. Under the new charter the Council convenes daily, except Saturdays and holiday; the city's affairs are conducted by the entire Council meeting in committee of the whole and the Councilmen devote full time to city matters, with salaries of $5,000.

These few points will serve to show that the background for the municipal operation of the street railways is a business administration of the city. It is said that probably no other large city in the country is as free from political or other corruption as is Detroit today, though it was one of the worst formerly. No small part of this is due to Mayor Couzens, a business man of independent means and with a high ambition to make the most of his city.

From the section of the charter dealing specifically with the street railway commission are found these additional reasons for the prospect of a successful municipal railway undertaking in Detroit. The commission consists of three members who serve without pay. For purposes of acquiring a railway property by purchase or construction, the City Council is authorized to issue bonds in such amount as will not exceed the legal bonding limit of the city and up to the amount of 2 per cent of the assessed value of the real and personal property of the city. Further bonds may be issued regardless of the city's bonding limit, but which shall impose no liability on the city and shall be secured only by the property and revenues of the street railway by them. The rate of fare must be sufficient to pay "(a) operating and maintenance expenses, including paving and watering between tracks; (b) taxes on the physical property of the entire street car system, the same as though privately owned; (c) fixed charges; (d) a sufficient per cent per annum to provide a sinking fund to pay the principal of the mortgage bonds issued at their maturity and such other additional per cent per annum to provide . . . a sinking fund to pay the principal of the general bonds issued as soon as practicable, to the end that the entire cost of said street railway system shall be paid eventually out of the earnings thereof." The railway department must also be operated on an annual budget basis.

Couple these provisions with the fact that the railway organization is altogether a thoroughly experienced one in private operation and is given an unusual degree of freedom in the exercise of railway judgment and it becomes apparent that the Detroit project taken as a whole gives sound reason to expect a good showing. Furthermore, under the provisions cited and with the knowledge that it is the desire and aim of the commission and management to have the department carry all charges that are met with under private operation, it is seen that the results will probably be as nearly comparable with private operation as will ever be obtained. There is left, in a major way, only the advantages and disadvantages inherent to public ownership.

Granting the above, would success in Detroit establish the success of municipal ownership as a principle? No. Unfortunately, if success does attend the undertaking, Detroit will be held up as the great proof. But it proves the principle only if the same fundamental background for municipal ownership can be set up in another city that has been in Detroit, a thing which is exceedingly doubtful, particularly for the larger cities. On the other hand, while for this reason success in Detroit cannot be taken as the general demonstration of the principle, failure in Detroit under all these favoring circumstances would deal a crushing blow to the theory of municipalization.

Calumet Station Adds 180,000 Kw. to Generating Capacity of Chicago Company

New Station of Commonwealth Edison Company Is Located in Great Industrial Section to the South of Chicago—Features Comprise Separation of Phases with Elimination of Short Circuit Possibility, Large Capacity Chain Grate Stokers, High Steam Pressure and Superheat and Integral Steel Economizers

CALUMET STATION, the fourth generating plant of the Commonwealth Edison Company, Chicago, with an initial installation of 60,000 kw., brings the total present capacity of the company up to 539,000 kw. Calumet is laid out for an ultimate capacity of 180,000 kw. and is located in the great industrial center just to the southeast of Chicago at 100th Street and the Calumet River. Here it will be in a strategic position to serve economically not only the tremendous growth of industrial activity in this great area to the south, but also to supply power for the terminal electrification of the steam railways. In the immediate district served by this plant there is probably the greatest network of railways that exists in any equal area in the world. The Illinois Central Railroad, having various lines through this territory, has already started its preliminary work, leading up to electrification within five years, and the next ten years will undoubtedly witness a great development along this line around Chicago. At present the Commonwealth Edison Company supplies all of the energy used by both the Chicago Elevated Railways and the Chicago Surface Lines with their 1,233 miles of track, and part of the power required by several other smaller electric railway properties extending out of Chicago. Whether this extensive service of power will be extended to include the steam railroads as they electrify is a problem of the future, but Calumet Station is there in readiness, if indeed the industrial load does not grow to exceed the ultimate capacity of the plant before the railroad load comes on.

Calumet Station has been planned to contain ultimately six 30,000-kw., 12,000-volt, three-phase, 60-cycle units, of which two have been installed. One of these was supplied by the Westinghouse Electric & Manufacturing Company and the other by the General Electric Company. This first section of the plant has been in operation for a few months and the work of extending the building for the next two units is already under way. The station is tied in with the Fisk Street station by means of two 33,000-volt, 350,000-circ.mil, lead-covered underground cables, each having a capacity of 15,000 kva. Up to date this is the highest voltage that has been used for transmission in a three-phase cable. The lines are sent through two 15,000-kva., 12,000 to 33,000-volt transformers connected to the station bus through 800-amp. reactors. At the Fisk Street end the voltage is stepped down by a similar installation of transformers.

One of the most interesting departures from former practices in generating station design is the wide separation of phases in the bus arrangement, a feature designed by B. G. Jamieson, engineer of inside plant for the company. Because of the enormous concentration of power on the bus system of the switch house, a design that would embody an unusually high factor of safety against a bus short circuit was developed. The buses are carried on three longitudinal walls placed 16 ft. apart, with one phase only on each wall. Like phases of the two main buses are installed, one on either side of each of these walls just below the ceiling of the first floor. The line buses are similarly arranged at the ceiling of the second floor on either side of similarly located bus walls. With this arrangement of buses, a special design of oil switch mechanism was required. The oil pots of the circuit breakers are installed on the second floor and the operating mechanism on the third floor. The arrangement necessitated a switch mechanism which would simultaneously operate the contacts in the three oil pots of a switch spaced 16 ft. apart.

Some of the Important Mechanical Features

In the mechanical design of the station a number of features have been incorporated which place it a step in advance of the older stations of the company. The boilers are slightly larger and are designed for an operating pressure of 350 lb. gage, as it is desired to furnish steam at the turbine throttle at a pressure of 300 lb. superheated 200 deg.; or to a final steam temperature of 622 deg. At the boiler the steam temperature will approximate 630 deg. F., as the safety valves are set to blow at 330 lb. Forced-draft chain grates are installed to burn Illinois coal. With one exception two stokers per boiler have been provided, and the one exception is a forced-draft chain grate of mammoth proportions. It measures 24 ft. wide and 18 ft. 6 in. long from inside the grate to the rear center. An individual steel economizer is placed directly above each boiler.

The heat balance of the station is maintained by bleeding steam at approximately atmospheric pressure from the main turbines through closed heaters which in conjunction with the open heaters raise the temperature of the feed water to 170 deg. F. The heat from the gland water and in all clean drips is conserved, and other economies are effected, which in the aggregate indicate the possibility of generating a kilowatt-hour at the switchboard on 18,000 to 19,000 B.t.u. The latter figure already has been obtained, and when all covering is on and the plant has settled into routine operation, the lower figure indicates the economy anticipated.

As may be seen from the sectional elevation of the plant the boilers are set on the second floor. Below the central firing aisle are the train shed for unloading coal and a storage pit having a capacity of 350 tons per boiler. On either side are the stoker ash hoppers, from which the ashes are dumped directly into railway cars without any intermediate handling. The forced-draft fans are on the boiler-room floor back of their respective boilers and the induced-draft fans are at either side of the boiler house on a level with the economizers above the boilers. They discharge into a smoke flue on the roof.

Four boilers per unit was the original plan, but the

Digitized by Google

Digitized by Google

seven boilers now installed have given such excellent results, operating up to 300 per cent of nominal rating without the least difficulty and delivering 150,000 lb. of steam per hour, that three boilers per generating unit of 30,000 kw. is now considered ample. With a steam rate approximately 10 lb. per kilowatt-hour, it is evident that two of the larger boilers could meet the unit steam requirement. As each boiler contains 15,089 sq.ft. of steam-making surface, the allotment of three boilers per unit provides 45,267 sq.ft. of heating surface to supply steam to a 30,000-kw. generating unit. This is a provision of 1.5 sq.ft. per kilowatt of generator rating. In each boiler there are 4,052 sq.ft. of superheating surface and 9,669 sq.ft. of economizer.

Six of the boilers are served by forced-draft chain-grate stokers, two per boiler, set under the low end. Each stoker has an effective area of 182 sq.ft., giving 364 sq.ft. per boiler. To give a wide range of speed the stokers are driven by direct-current motors. Air is supplied by induction-motor-driven multivane fans mounted on the boiler-room floor, and controlled by push buttons on panels at the boiler fronts. The same type of control from the same location is applied to the induced-draft fans. Here also are the instruments in full view of the firemen while making the necessary adjustments of draft pressures and stoker speeds.

A feature of the furnace is the elimination of the bridge wall. Water-backs connected into the boiler circulation protect the rear wall, and ventilated tile at the clinker line afford protection to the side and center walls. Flat suspended arches of the new radial-end type are installed.

With the bottom of the front tube header 15 ft. 4 in. above the floor and the boiler tubes at the entrance to the first pass approximately 20 ft. above the grates, a furnace volume of 6,700 cu.ft. is secured. This is a provision of 18.4 cu.ft. of furnace volume per square foot of grate area, or roughly 0.3 cu.ft. per pound of coal burned at a combustion rate of 60 lb. of coal per hour per square foot of grate surface.

Under the seventh boiler the installation of the larger stoker is under way. As previously stated it is 24 ft. wide and 18 ft. 6 in. long with an effective area of 444 sq.ft., as compared to 364 sq.ft., the aggregate area of the two stokers serving each of the other boilers. Although the grate surface is continuous, the stoker is made up of two separate chains, with the driving shafts coupled at the center and a driving motor at either side, the two being under common control.

How Ashes and Coal Are Handled

Ashes are discharged from the rear end of the stokers into 50-ton hoppers placed directly underneath. These hoppers are protected against the action of the hot ashes and are provided with a sprinkler system for wetting down before they are discharged through pneumatically operated gates into railway cars.

Coal is unloaded immediately under the central firing aisle of the boiler room by means of a traveling crane which discharges either into a large storage pit or to a traveling hopper.

From the hopper the coal is fed onto a belt conveyor having an ultimate capacity of 400 tons per hour. The delivery is through a Bradford breaker serving the present installation. With the next addition to the plant another breaker will be installed and the belt will then deliver to each unit at the rate of 200 tons an hour. Although this type of breaker is used extensively in the byproducts coke industry, this is the first installation of the kind for a central station. Tramp iron, sulphur balls, mine props and any other refuse that may be in the coal are held back and passed out at the end of the breaker onto a belt conveyor. Here the refuse material is picked off and any good coal that may have been carried out of the breaker with it is allowed to pass on to another conveyor delivering into a small two-roll crusher which discharges into the pivoted bucket conveyor carrying the coal to the top of the boiler house.

Coal from the breaker passes into collecting hoppers and is fed onto a short belt conveyor which is reversible and may feed either one of two pivoted bucket conveyors elevating the coal to the overhead bunker level.

From the pivoted bucket conveyor the coal is passed into either one of two receiving hoppers which discharge directly onto belt conveyors running longitudinally above the coal bunkers. One set of reinforced-concrete bunkers, with individual capacities of 250 tons, serves each row of boilers.

Maintaining the Heat Balance

One of the features of the station is the arrangement of the feed-water system and the method of maintaining the heat balance. Temperature of the feed water will be maintained about 175 deg. F. to prevent condensation of the sulphurous acid in the flue gases and thus eliminate to a great extent the external corrosion that would otherwise take place in the steel economizers. Essentially, this is accomplished by introducing a closed heater between the condenser hotwell and the usual open feed-water heater. From the main turbines at about atmospheric pressure sufficient steam is bled through the closed heater to maintain the water in the open heater at the temperature previously given. A recording thermometer in the boiler room shows the temperature of the water in the open heater at all times and guides the operator in varying the amount of steam bled from the turbines by adjusting a hand-operated valve in the bleeder line.

To heat the condensate, a certain amount of exhaust steam from auxiliaries as well as the discharge from steam traps is available. Three of the four boiler-feed pumps are turbine-driven. There is also a 50-hp. turbine-driven service pump, and with the exception of the circulating pumps the condenser auxiliaries are in duplicate, one set being driven by turbines and the other by motors. As many of the auxiliaries as the heat balance will permit will be electrically operated.

An open heater rated to heat 400,000 lb. of water per hour from 85 to 175 deg. F. is provided for each unit, the two being connected in parallel. The closed heaters are practically of the same capacity. The arrangement of the piping and auxiliaries for both units are practically identical with the exception of the gland heated and the hydraulic air pumps. The use of steam seals in turbine No. 1 made it desirable to recover the heat in this steam by passing it through an additional closed heater. The condensation from both of these closed heaters is returned to the hotwell of the condenser. The condensate pump draws from the hotwell of the condenser and forces the feed water through the closed heaters to the open feed-water heater. It then passes down to the feed pumps, which are cross-connected on the discharge side to give flexibility, and is forced up through the economizers to the boilers

against a head ranging from 380 to 400 lb. gage. Another path is through the auxiliary feed or wash line which bypasses the economizers and leads directly to the boilers. Feed-water regulators control the supply entering each boiler.

As previously stated, two generating units have been installed, each having a capacity of 30,000 kw. at 85 per cent power factor. The Westinghouse unit is a tandem compound machine having a speed of 1,200 r.p.m., and the General Electric unit develops the entire capacity in a single casing, the speed being 1,800 r.p.m. The condensers are of the surface type with 52,000 sq.ft. of surface, which reduces to 1.73 sq.ft. per kilowatt of generator rating. For each unit one circulating pump of the slow-speed type is installed. The other condenser auxiliaries are installed in duplicate, one unit of the pair being turbine-driven and the other motor-driven.

The Westinghouse unit has two condensate pumps each rated at 1,000 gal. per minute, with 100-hp. 2,300-volt induction-motor drive in one case and a 60-hp. turbine in the other. The air pumps are of the Leblanc type. For the General Electric unit hydraulic air pumps are employed. Four units are installed, although normally two will take care of the requirements. The installation includes hurling-water pumps and a tank to store the water circulated through the air nozzles.

Power Supply and Control of Auxiliaries

As much of the auxiliary apparatus in the station is motor-driven, elaborate provision has been made to insure the continuity of the electric supply. All auxiliary motors larger than 100 hp. are on 2,300-volt service and those below 100 hp. are designed for 440 volts, with the exception of the stoker motors, which are 220-volt direct-current machines. To supply these services stepdown transformers are connected to a special 12,000-volt bus placed in the transformer house.

For the 2,300-volt auxiliary service three buses have been provided—a 1,200-volt starting bus, a 2,300-volt running bus and a transfer bus, the last being an alternate to the running bus and supplied by an emergency transformer from the opposing section of the main auxiliary bus. The 2,300-volt auxiliary power center is located in the transformer house at the turbine-room floor level. All service switches for the large motors are installed in this location and arranged for remote control from the motors. Compensating starters are employed only on the 440-volt motors.

Throughout the station 220-volt direct-current control is employed. The operating bus is supplied by either one of two 200-kw. motor-generator sets, with a 120-cell, 1,500-ampere-hour storage battery floating on the line. From this same bus the stoker motors are driven and it is also an emergency source for excitation of the main generating units.

Safety Campaign of Steam Railroads

A FOUR months safety campaign of the steam railroads, designed especially to eliminate accidents at grade crossings, will begin on all the roads in the United States and Canada on June 1. It is under the direction of the American Railway Association and has been indorsed by President Harding. A poster has been prepared by the steam railroads for use in passenger stations and elsewhere, representing an automobile attempting to cross the tracks in front of an approaching locomotive.

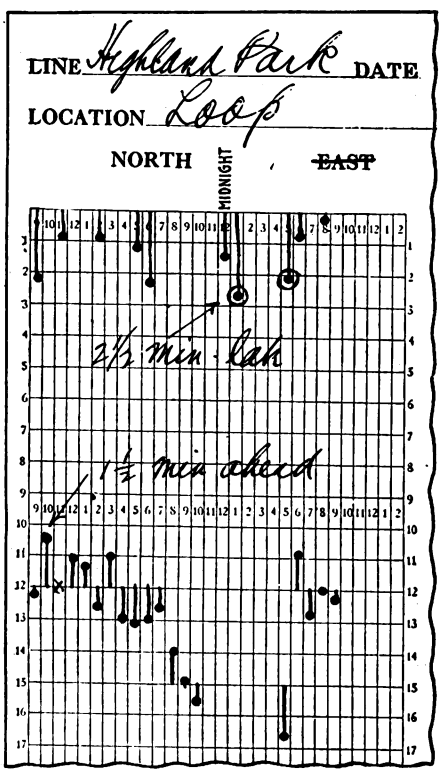
Letters to the Editors

Checking Schedules in Baltimore and Elsewhere

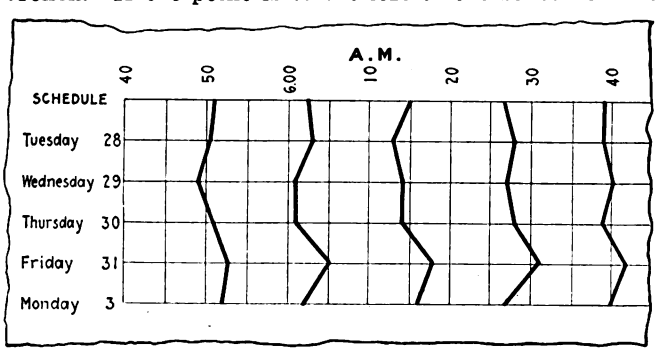
LOUISVILLE, KY., May 9, 1922.

To the Editors:

I note the reference on page 744 of your issue of May 6 to a method employed in Atlanta for plotting actual time. It may not be generally known that there is a commercial device for recording actual time of cars at a time point and operated automatically by the cars themselves. The record is revolved on a cylinder and is printed through typewriter ribbon in the form of dots along a spiral line, which, when unrolled, is in the form of oblique parallel lines on a sheet of paper. It is easy to draw lines from the points made by the car to the points indicating the schedule time. The length of these lines then shows how much the car has departed from schedule, and the direction of them, whether ahead or late. A part of such a sheet is shown herewith. From several of these records, taken on successive days, a comparison of performance may be graphically shown as in the second illustration. In this chart the vertical line to the left gives the correct schedule, while the curve shows the actual arrival time on successive days. The points for each run number are then connected together. If the cars conform to schedule, each run number will produce a straight vertical line, but as they depart from schedule this line will be more broken. If the point is to the left of the schedule time



PORTION OF RECORD FROM HEADWAY RECORDER (LENGTH OF LINE SHOWS DEPARTURE FROM SCHEDULE)



PORTION OF SHEET USED IN BALTIMORE FOR COMPARING ACCURACY WITH WHICH CARS KEEP TO SCHEDULES ON SUCCESSIVE DAYS

Digitized by Google

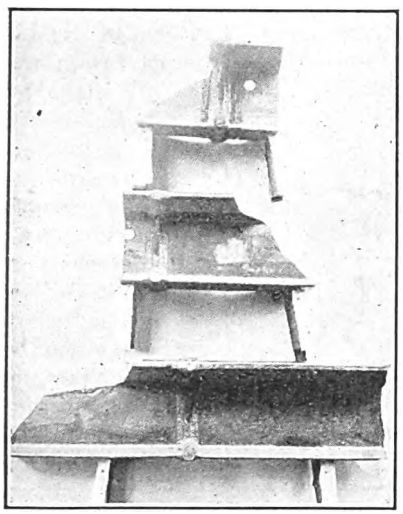
it shows that the car was ahead of time, but if to the right the car was late. Each motorman can therefore see his records on successive days in an instant.

This method of plotting the results from the Automatic Headway Recorder is to be credited to J. A. Stoll, superintendent of traffic United Railways & Electric Company, Baltimore, Md. CARL P. NAGHOD.

Thermit Weld Cost Reduced

SAVINGS varying from $2 to $3 per joint have been made possible by the recent development by the Metal & Thermit Corporation, New York, of a modified Thermit insert rail weld, wherein the usual reinforcing collar is so proportioned as to give a perfect weld with considerably less Thermit than was formerly believed necessary.

The modified weld, known as the "center pour weld," involves no fundamental changes from the type of Thermit insert weld which has been used extensively for ten years by street railways throughout the United States. By making a great many welds and then breaking them, it was found possible gradually to change the design of the pattern so as to utilize the Thermit steel collar in the most scientific manner and to best advantage. A slight rearrangement has also been made in the proportions and locations of the pouring gate, heating gate and riser. A narrower gap is also used between rail ends. It has been found that an average of ½ in. gap will give the best results. The saving in using the new weld consists not only in a saving of the Thermit welding portions, but also in the crucibles, as a much smaller crucible can be used, which in turn gives several more reactions per crucible lining. An average of twenty-five or more reactions per crucible lining can be obtained.



RESULTS OF DROP TESTS ON WELDED JOINTS

When used in conjunction with new style self-luting mold boxes, which require no hand luting whatsoever, the operations merely require clamping the molds to the rails, preheating and pouring. The preheating takes from twenty minutes to a half hour per joint and the number of joints which can be welded in a day is only limited to the number that can be preheated. When two joints are preheated at a time, there should be no trouble in making thirty-five to forty joints per day with a comparatively small gang.

Thermit insert rail welding operations have also been simplified by the perfection of a new Thermit mixture which develops such heat that the additions can be mixed cold in it instead of being put in a can and preheated.

Under recent repeated drop tests, sections of rail welded by this method broke entirely outside of the weld in every instance, thus demonstrating conclusively that the weld was absolutely as strong as the rail. The detailed results of the drop tests are shown by the following data and in the accompanying illustrations:

Test No. 1:

Rail section welded—L. S. Co. 134-506.

Nature of test—Foundation and support of rail tested, the rail supported on semi-elastic foundation, *i.e.*, steel plates were laid on the dirt floor of the welding shop, on the top of which were placed 6-in. tee rail, and the rail to be tested in turn placed upon this tee rail on 3-in. centers.

Weight used: 2,500 lb. Heights of drops: 20 in., 30 in., 48 in., 79 in.

Result: The last drop was as high as could be given and no deflection or breakage occurred.

Test No. 2:

Rail section welded—Same as in Test No. 1.

Nature of test—Foundation and support of rail tested—foundation consisted of two 10-ft. square steel billets each 3 ft. 8 in. long imbedded horizontally in the dirt floor of the welding shop. On these billets were placed 6-in. tee rail on 3-ft. center.

Weight used: 2,000 lb. Height of drop: One 9-ft. drop only.

Result: Rail tested broke entirely through the rail steel adjacent to the thermit collar.

Test No. 3:

Rail section welded and nature of test similar to test No. 2 except:

Height of drop: One 30-in. drop only.

Result: Rail broke through the base 3 in. from weld, proving conclusively a rail failure and not a weld failure.

Test No. 4:

Rail section welded and nature of test similar to Test No. 2 except:

Heights of drops: 12 in., 18 in., 24 in., 30 in., 40 in., 50 in., 72 in., 100 in.

Results: No deflection was noted until 40-in. drop was made. As nearly as can be measured, this deflection for the 3-ft. span was about .005 in. and the deflection after the 72-in. drop amounted to a total of .014 in. The rail broke at the 100-in. drop 14 in. from the weld at the base diagonally up through the rail to a point about 7 in. away from the weld on the head, which also proves a rail failure and not a weld failure.

Test No. 5:

Type of rail tested and nature of test similar to Test No. 2 except:

Heights of drops: 30 in., 48 in., 66 in.

Results: No deflection took place at the 30-in. drop. A deflection of .008 in. occurred at the 48-in. drop and the rail broke at the 66-in. drop. The fracture occurred 17 in. from the weld at the base and fractured diagonally up through the rail, emerging through the head 4½ in. from the weld, thus showing a rail and not a weld failure.

NOTE: In none of the tests Nos. 1-5, inclusive, did the total length of rail after welding exceed 4 ft.

Test No. 6:

Rail section welded: 9 in. L. S. Co. 134-470. This section and section L. S. Co. 134-506 (used in previous tests) are almost identical; the only difference being that the 506 section has a slightly curved contour on the running surface of the head, whereas the 470 section is flat.

Results: No deflection occurred at the 30 in. or 48 in. drop. A deflection of .005 in. occurred at the 66-in. drop and the rail broke at the 104-in. drop. The break occurred through the base 8 in. from the weld and ran diagonally upward toward the weld, breaking through the head alongside of the insert and 1¾ in. away from the weld through the lip. There was a bolt hole through the web of this rail about 2 in. away from the weld and the broken specimen shows a crack extending from this bolt hole toward and through the weld. It is possible that had this crack at the bolt hole been absent, the rail may have broken completely through the head away from the weld.

The modified insert weld was demonstrated on May 12 before the members of the committee on way matters of the American Electric Railway Association at the Jersey City plant of the Metal & Thermit Corporation. One man was able to make a mold, preheat and pour a weld in less than one hour's time. As nearly half of this was devoted to preheating alone it is evident that a welding gang of say five men can proceed at a much more rapid rate by dividing the work.

Overhead and Car Current Collecting Devices*

Wear on Wheels and Trolley Wire Is Shown to Be Due to a Combination of the Qualities of Both, Together with Operating Conditions—Relative Merits on Wheel and Sliding Shoe Are Discussed

By Leslie E. Delf
Electrical Engineer Northern Texas Traction Company, Forth Worth, Tex.

THE collection of current for electric cars from an overhead wire involves three essential parts of equipment, namely, the trolley wire, the contact element, whether wheel, sliding shoe or bow slide, and the trolley base. Each plays an important part in the operation. On most railways the care of the trolley wire is in the hands of the electrical engineer or line foreman, while the master mechanic has supervision of the wheels and bases. This has sometimes led to each doing his best to keep his particular part of the equipment in good condition but failing to consider whether that condition is best for the other man's part of the equipment.

The fundamental requirements of the current collective device are: first, minimum wear on wire; second, minimum wear (and consequently minimum cost per 1,000 car-miles) on wheel or slide; and third, negligible power loss in collection operation. This last-named has a direct bearing on the other two and can, for all practical purposes, be included in them, for excessive power loss will produce heating and burning which will reduce life of both wire and wheel.

Hard-drawn copper has been the standard material for trolley wire for a number of years. For operation on this type of wire a wheel was developed having an analysis of approximately 91 per cent copper, 8 per cent tin, 1 per cent zinc, lead and impurities. This combination of wire and wheel gave excellent service until traffic condition became so severe, particularly in downtown districts, as to demand a wire having greater wearing qualities. This demand was met by the production of copper-alloy wires, the best-known and apparently most successful of which is phono-electric. War conditions brought about the use of some galvanized steel wire on certain properties. Recently a new copper-alloy, known as cadmium-copper-alloy, has been used in certain Canadian cities with considerable success.

The hardness of both the wire and the wheel has bearing upon the life of both. The harder the wheel the longer will be its life and consequently the shorter the life of the wire on which it runs. Hard-drawn copper wire with the present trolley wheels seems to be a happy combination in so far as with them the total wear is just about at a minimum. Both copper-alloy and steel wire are considerably harder than hard-drawn wire. Our experience indicates that they have two or three times the life of hard-drawn copper under the same conditions. However, our records show that during the few years that we have been increasing the use of such wire the average mileage of our trolley wheels has dropped steadily, year by year, from around 20,000 miles to 3,219 miles in 1921. Some other factors such as increase in schedule speed may have entered into this drop, but still other factors such as the reduced current consumption of the safety car should tend to offset them.

This reduced life of trolley wheels has not been due only to the abrasive wear caused by the wheel traveling over the harder wires. These wires present a smooth surface on the underrun due to the uniformity and slowness of their wear. This surface is so smooth that it often does not give sufficient friction between the wire and wheel to cause the latter to revolve. This action is very intermittent with the six-inch wheels running on one-inch pins that are used on this property and depends a great deal upon the condition of the wheel bearing and its lubrication. It has been most frequently noted when a car first starts up as at that time the inertia of the wheel is added to the static friction of the bearing and so gives the worst condition tending to cause the wheel to slide rather than roll. Once a flat spot is started on the throat of a wheel it is rapidly increased by the pounding it produces on the wire when the wheel is revolving at high speed. The harder the wire the faster the flat spot develops. On one line on which we have 3 miles of steel wire, wheels pound so badly after 900 miles operation that they have to be removed although the throat is far from worn out.

Last summer trolley breaks on our city lines started to increase at an alarming rate. All were in comparatively large sized wire and were located in the ears at that point about an inch from the end, where the wire commenced to be rigidly held by the ear. Each break showed evidence of crystallization or fatigue of the copper at that point and indicated that it had been in progress of fracture for some time. A study of conditions led us to the conclusion that the pounding of the wire by trolley wheels with flat spots in the throat had set up vibrations which traveled to the ear and were there damped out by the larger mass of the ear, the energy of these vibrations being expended at the point which subsequently developed the break. Relief was sought by equipping most of our regular cars with trolley shoes. As these fractures require considerable time to develop and consequently there were probably a number at various points on our lines that had not progressed to the point of failure, we cannot say positively that our assumptions were correct, but the pronounced reduction of breaks would indicate that they were not far from right.

The action described above is so much greater on wheels operating on steel wire than on those operating on copper-alloy wire that we shall discontinue the use of steel wire on lines on which wheels are used. It is necessary, however, to provide a wire harder and with a longer life than hard-drawn copper to meet heavy traffic conditions and so we cannot afford to go back to hard-drawn copper wire where these conditions obtain. This means that if we are to maintain our old standards of current collection costs some collection device must be developed which will eliminate the troubles experienced with the present trolley wheel when operated on copper-alloy wire.

This company conducted its first test of the sliding shoe collector by equipping two cars with Miller trolley shoes in March, 1921. The two shoes on one car were removed as worn out in February, 1922, operating 28,600 miles apiece. The other pair are still in use after covering 21,229 miles each. In September the trolley break situation mentioned above became so bad that we commenced equipping other cars with shoes until we now have seventy-four cars using them. These latter shoes have not shown the mileage that the four test shoes developed. Thirty-four shoes have worn out to date having operated an average of 8221.7 miles each. The wearing qualities of the individual shoe have varied greatly. On one car the shoe on one end outwore three shoes on the other end, both covering the same mileage on the same line.

The operation of the shoe on copper-alloy wire is excellent, both wire and shoe taking a high polish. This same polish develops on steel wire, but the wear on the shoe is excessive. Average life of shoes operating on a line with about 3 miles of steel wire is approximately 3,300 miles. The action of the shoe on hard-drawn copper wire has been extremely variable. Certain wire, chiefly that purchased prior to 1917, takes a high polish similar to the harder wire, but other wire, as a rule that put up more recently, shows signs of considerable scraping action from the shoes. Lack of statistical data on wire wear with wheels renders it impossible to compare the action of wheel and shoe under similar conditions, but an average of micrometer measurements on several representative lines outside the business district indicate a life of about five years for hard-drawn copper wire when used with the shoe.

The shoe rides the wire and special work better than the wheel. A considerably lower trolley tension is pos-

*Abstract of paper presented before the Street & Interurban Railway Section of the Southwestern Electrical & Gas Association, San Antonio, Tex., May 3-6, 1922.

Digitized by Google

sible and there is less arcing and pounding at ears than with wheels. We have found, however, that when the shoe has been worn so that a groove is cut in its throat somewhat larger than the diameter of the trolley wire, the shoulders of this groove tend to cut out the sides of ears and sleeves and permit the wire to drop. We find that the shoe handles sleet on trolley wire a great deal better than do wheels. One objection to the shoe on the part of the trainmen is that it is not safe to back up a car equipped with shoes, but this disadvantage is offset in the minds of most of the men by the superior manner in which the shoe passes through special work and stays on the wire.

The tension used to keep the shoes or slides upon the wire determines in a large measure the life of the wire and collecting device. Excessive pressure causes undue wear on both wire and wheel or slide and increases wire breakage due to bending of wire at ears especially where the trolley wire is slack. On the other hand, too little tension will mean a large number of wild trolleys and consequent damage to span and trolley wire. It also will permit the wheel or slide to leave the wire when hitting ears and so produce arcing at the approach end of the ear and a pounding of the ear and wire when the wheel again seats itself against the wire. The result of this pounding is usually seen at the center of the ear. The proper tension to use on any given system will depend on the accuracy with which the trolley wire is aligned and special work is adjusted, maximum height of wire, weight of shoe or slide and the sensitiveness of the trolley base. Using a 6-in. wheel we have secured best results with about 30 lb. downward pull with trolley wheel 18 ft. above the rail. With a Miller shoe we get best results with about 22 lb.

Tests recently conducted in the Fort Worth shops on a number of different types of bases indicate that practically all bases have sufficient freedom of movement in the horizontal plane when in good condition. It was found, however, that the friction in the base, opposing movement in the vertical plane, varied over a wide range and was dependent upon the make, amount of wear and lubrication of the base.

With the light-weight base that is installed on all our safety cars we found that it required 35 lb., as measured by spring balance attached to the trolley rope, to produce a downward movement of the pole, but that the pole only pulled, say 11 lb., against the spring when it started its upward movement again. This means that the trolley wire must take a pressure of 35 lb. when the pole is moving downward when approaching the center of a span and when striking an ear but that there is only an effective pressure of 11 lb. available to keep the wheel on the wire through special work or where the tendency for the pole is to rise.

An average of tests on a number of this type bases showed that it took 24 lb. more to lower the pole than to raise it. These tests were made on cars that had been in operation for some time and some of the bases were considerably worn. The bearings involved in vertical movement were then lubricated with "3-in-1" oil and the friction was reduced by from 12 to 5 lb. Similar tests made on new heavy-type bases averaged 3.4 lb. difference between the up and downward pull on three makes of bases.

A net difference of 6 lb. should be considered a maximum allowable variation on a good base on account of friction. The manufacturers of the light-weight base have made changes that are intended to overcome the excessive friction of this base and results of tests on this base should be available soon.

Directors of Public Information Bureaus Meet

DURING the week of the N. E. L. A. convention there was also a meeting of the directors of the various state public utility information bureaus. These directors held two most interesting sessions during the week, interest in which is as much from the electric railway as from the electric lighting industry.

Animated and constructive discussion of the most successful ways and means of getting the utility story to the people marked the first meeting. J. B. Mullaney, director of the Illinois committee, acting as chairman, directed the discussion of the papers and every vital point was dwelt upon. Four papers were read and discussed during the afternoon.

Four salient points are to be remembered if a public utility information bureau is to be a success, H. M. Lytle, associate director of the Illinois committee, declared in his paper, "The Newspaper Relationship." These points are: (1) There must be constant thought and effort. (2) The so-called press-agent type of publicity man has proved to be a flash in the pan. (3) Information must be collected and collaborated from every branch of the industry, for at best the individual knows only his own department. (4) More progress in educating utility employees in their business has been made in the past three years than in all the previous years combined, but this in reality is only a step. It was pointed out that few utility companies have even as yet organized themselves in a publicity, advertising or public relations way. Many continue to buy expensive space in advertising columns and then fill it with badly written matter which creates no good impression except upon the man who wrote it. Definite technique is required to do this, and it takes a skilled workman to tell a story in an advertisement successfully.

Speakers' Bureau of Vital Importance

Operation of a speakers' bureau in connection with state committees on public utility information is so vital, said Benjamin E. Ling, director of the Ohio committee, in his paper, "Public Addresses as Good-Will Builders," that it is doubtful whether this great co-operative effort at gaining good will for the public utility can be successful without it. The messages about the public utility industry which these public speakers have been able to "put across" in Ohio have had most pleasing results, and he thought that these results can be duplicated in every other state.

Excellent results were pointed to as a result of personal letters from the bureau directors when editorials and articles appeared in the press which showed misinformation on the part of the editor. Copies of such letters—which naturally treat only of the general utility situation and not of any local problem—are sent to utility executives in the city where the newspaper is published, so that, if advisable, information as to the local aspects may be added to the general information.

In his paper, "Possibilities in Public Utility Conventions," Alfred Fischer, director of the Michigan committee, dwelt on the possibilities of making the utility convention a great public mass meeting. He pointed out the desirability of throwing open the doors of the convention to the public and particularly emphasized the value of making the power plant available for public inspection. Mr. Fischer brought out the fact that the most successful means of reaching the public has been to leave discussion of utility problems out of the picture until the agricultural, industrial and civic dependence of a community upon electric power has been explained. Then the relation of the utility development to the communities' growth will naturally follow and be understood by the public.

The enormous value of imbuing engineering students with proper ideas of utility problems was emphasized by Horace M. Davis of Lincoln, Neb., who cited several specific cases where direct benefit had resulted from holding state conventions at the state universities and colleges. Participation in the convention programs by the engineering faculty has been found to be highly advisable, as it brings out an unusually instructive interchange of viewpoints.

In discussing this phase of public utility information the good moral support of the manufacturers was commended, and it was held that the value of the publicity efforts made by these manufacturers in the past cannot be overestimated. It was pointed out, however, by Howard T. Sands of Boston that it is now the duty of the utilities themselves to bear all the expense of this publicity.

Nothing can be so important as education relative to the utility industry,

Digitized by Google

for it is its cornerstone, declared E. E. Lincoln, head of the chair of public utilities of Harvard University, at the second meeting. In Harvard University this is considered one of the most important subjects. There is the most profound ignorance relative to all public utility affairs. There is nothing too elementary to explain. For thirty years men in the utility business have gone on assuming a situation—assuming that the public knew about their business—and the public has known nothing.

John C. Mellett, director of the Indiana Committee on Public Utility Information, told of the co-operative effort under way in that state with the public schools, particularly high schools and colleges. A series of pamphlets, duplicating those published by the Illinois committee, has been sent to those schools requesting such pamphlets. These requests are brought through letters sent to the school superintendents advising them of the committee's work in preparing such informative matter.

H. M. Lytle, for the Illinois committee, said that it first had dealt with 356 high schools, but that since then the list had been expanded to 887 high schools and thirty colleges and universities of the state.

Joseph B. Groce, director New England Bureau of Public Service Information, declared that there is a necessity for the closest co-operation between the various state committees and the national associations. He said the big work before the committee and the national associations is to sell to America the knowledge that the utility industry is second only to farming as the nation's greatest enterprise and that it is a great industry whose essential character is such that unless it progresses and prospers the nation cannot prosper.

Labert St. Clair, publicity manager of the American Electric Railway Association, and Charles W. Person, secretary advertising section, American Gas Association, who were present, volunteered the closest co-operation with the state committees. Mr. St. Clair said that the state committees were close to the ground and could localize publicity and educational effort in a way that would get actual results which such effort directed from a centralized source could not hope to accomplish.

H. T. Sands, chairman public relations committee, N. E. L. A., said that the work of the committees must be carried out on state lines, that there must not be too much organization between the various state committees, and that they must continue their policy of hammering home the truths relative to the industry and staying out of controversies.

To work out a clear-cut program of co-operation between the state committees and the national associations, it was resolved to appoint a committee from the state directors to meet with the secretaries of the three national associations.

Some Post-War Problems of the Utilities*

Need of Legislation to Give Utility Securities a Wider Market—Advantages of Customer Ownership—Trend in Legislation and Regulation

BY CARL D. JACKSON
President National Association of Railway and Utilities Commissioners

ABNORMAL war conditions directly affecting public utility service and finance served to bring home clearly to the country fundamental economic laws. The public came more clearly to understand the importance of all kinds of public utility service in respect to every phase of daily life and recognized that adequate service could be obtained only through fair treatment of investors' capital dedicated to public use.

The war period also served to emphasize the short-sighted financial policy of many utility corporations and the necessity for broader and more farseeing and elastic policies in this respect if the utilities are to meet the full measure of public obligation on their part. Difficult as was the situation for many utilities during the war period, it is plain that post-war conditions have brought in their wake problems that must be met wisely if future progress is not to be seriously retarded. A greatly increasing demand for utility service is an outstanding characteristic of our economic development.

The capital requirements of which I shall shortly speak, which must be met if we are to reap the economic benefits in sight, are not only very great in amount, but the supply of capital is more or less controlled and curtailed by certain governmental policies calculated to affect very adversely not only the utility industry but all productive industry in the country. I refer, of course, to the tremendous flood of tax-exempt securities already issued and being issued in increased magnitude.

The present federal tax laws must necessarily handicap the securing of capital upon the most reasonable rates of interest, but the issuance of tax-exempt securities has deprived every industry, including the public utility industry, of a very important source of capital, and such capital as is now thus secured from the individual investor is generally secured on onerous terms.

The unquestioned desirability of a large volume of public utility securities for permanent investment is generally recognized. Such investments in the utility field, however, have not in many states received the full legal recognition to which they are entitled because of the highly important public function they are performing and the solid nature of the security offered. The system of regulation now in force in most states entitles the utility industry to the same recognition accorded the older branch of utility represented by steam roads.

There are thirty-one states in which there appears to be an entire absence of statutory authorization to savings banks for investment in gas, electric, telephone or electric railway securities, and two others in which authorization is lacking except for electric railways. The history of public utility securities entitles them to confidence. Practically all such issues are supervised by state agencies of reponsible authority. The utilities are essential to every-day modern life. The welfare and progress of the country depend upon their encouragement and development. Archaic statutes enacted to meet situations of half a century ago should give way to non-discriminatory provisions recognizing the public interest in utility investment and placing these public utilities on a fair competitive basis in the money market.

Customer ownership should be encouraged in every way, not entirely because it is a source of capital, but because it constitutes the simplest form of actual public ownership and because the reciprocal responsibilities of customers and utility management will thus be emphasized.

The tendency during abnormal times growing out of the war was to seek a remedy for every unfavorable condition through legislation. Commissions, like other boards or administrative bodies, are established in compliance and to comply with the law and constitutional principles. When, as sometimes happens, serious questions arise as to the proper course of administration, such boards or commissions should welcome judicial review and interpretation, and if in the course of an orderly procedure in court for the protection of constitutional rights it shall appear to interested parties that technical or unreasonable rules of evidence are applied believed to be prejudicial, the remedy is not by legislation but by having such rules of evidence duly passed upon by the courts after fair presentation. This government, our institutions, our most highly prized rights, are dependent upon the constitutional and legal provisions for the protection of everybody. Any attempt to change or interfere with the orderly and due processes of courts in maintaining such rights is aimed at the liberties of the people.

Problems of regulation are coming to be better understood, and commissions and courts are breaking away from such doctrines as theoretical loss in value through so-called depreciation and the arbitrary cutting down of legitimate investment for the purpose of meeting a theoretical loss in value having no relation to cost of retirement and that will never occur, which cutting down of investment can only add to any possible difficulty of meeting any loss in retirements if it should occur.

It is to be hoped that the uni-

*Abstract of address before the National Electric Light Association at Atlantic City, N. J., May 18, 1922.

Digitized by Google

form system of accounts proposed by the National Association of Railway and Utility Commissioners may be generally adopted and become the basis of a more uniform and fair treatment of such questions. Another error that is sometimes made is in treating "investment" as though it were synonymous with "original cost," the latter term meaning original cost of physical property still existing. Often "investment" and "original cost" may mean the same thing, but sometimes they may be materially different. Investment may be absolutely necessary, especially in the earlier years of enterprise which represents something beside the original cost of tangible property. Most of the commissions have recognized this fact, though no general rule seems to be possible, and the commissions, it seems to me, rightly scrutinize claims of this nature with care, recognizing such claims only where equity pretty clearly calls for that treatment.

Iowa Association Summer Meeting

THE summer meeting and outing of the Iowa Electric Railway Association will be held at the Inn Hotel, Lake Okoboji, Iowa, on June 20, previous to the sessions of the Iowa Section of the National Electric Light Association, and not following them on June 23, as was initially announced. The Iowa railway men will hold a separate session on Tuesday morning, June 20, and in the afternoon will meet in a joint session with the electric light men. The Iowa Section of the N.E.L.A. will hold separate sessions on Wednesday, Thursday and Friday mornings, June 21 to 23 inclusive. The afternoons of these three days will be left vacant for entertainment and recreation of the delegates and their guests.

The tentative program arranged for Tuesday morning, June 20, is as follows:

A paper on "Thoughts on Inspection" by P. H. Diehl, Railway Audit & Inspection Company, Chicago. The following subjects will then be discussed: Fare schedules for street railways; one-man cars; motor vehicle transportation; regulation of rail and motor vehicle transportation; motor vehicle transportation on the public highways.

At the joint afternoon session with the Iowa Section, N.E.L.A., June 20, papers or addresses will be presented as follows:

"The Preparation of a Valuation for Rate-Making Purposes," by L. R. King, appraisal engineer United Light & Railways Company, Davenport, Iowa; "Valuation of Public Utility Property," by H. M. Engh, American Appraisal Company, Milwaukee, Wis.; "Group Insurance for Employees," by Peter F. Bouquet, Metropolitan Life Insurance Company of New York, St. Louis, Mo.; "Customer Ownership of Public Utility Securities," by H. E. Weeks, United Light & Railways Company, Davenport, Iowa; Dwight N. Lewis, chairman Iowa Railroad Commission, Des Moines; "Recent Court and Commission Decisions Affecting Public Utilities in Iowa," by John A. Reid, Iowa Railway & Light Company, Cedar Rapids, Iowa; William Chamberlain, United Light & Railways Company, Cedar Rapids, and George A. Lee, Continental Gas & Electric Corporation, Omaha, Neb. These will be followed by a report of the Iowa Committee on Public Utility Information by F. J. Hanlon, chairman governing committee, Mason City, and Joe Carmichael, director, Des Moines.

New Hampshire Street Railways and Power Developments

AN INTERESTING address on the development of street railways and electric power systems in New Hampshire was presented at the Manchester meeting of the New England Street Railway Club on May 25 by Frederic E. Webster, vice-president and treasurer Massachusetts Northeastern Street Railway, Haverhill, Mass.

According to Mr. Webster, the present electric railways in New Hampshire, with 240 miles, represent the outgrowth of lines started as horse railroads, among them the road in Manchester chartered in 1864, and he declared that a great deal of credit is due to the street railway pioneers of the sixties, seventies and eighties for their public spirit in going ahead with these charters. The first electric railway in the state was the Dover, Somersworth & Rochester, chartered in 1889 and open for business Aug. 8, 1890.

The early street railways were constructed by men who were residents of the towns in which they were located. They had in view the development of these towns more than the net earnings of the road and each stockholder took as many shares as he thought he could afford.

The first report of the railroad commission in New Hampshire was issued in 1884, when the mileage of horse railroads in the state was 12.68. By 1892 there was an awakening as to the part that street railways would play in the growth of a community. At that time there were five roads in the state. By 1896, 60 miles were in operation by seven companies. None of the companies in that year made any allowance for depreciation and only one paid a dividend. In 1902 the "Lovell System," the predecessor of the Massachusetts Northeastern Street Railway, was organized to consolidate a number of the existing properties and build others.

The speaker referred by name to some of the pioneers in street railroading, including E. C. Foster, J. Brodie Smith, Wallace D. Lovell, David A. Belden, Franklin Woodman, Ralph D. Hood and Arthur W. Dean. He also spoke of several of the early railroad commissioners, and reminded his hearers that Moses Gerrish Farmer, born at Boscowen and educated at Andover in New Hampshire, constructed the first electric locomotive.

C. E. R. A. Boat Trip

THE Central Electric Railway Association has prepared the following program for its summer meeting on June 25-30, to be held on the S.S. *South American*, while cruising the Great Lakes.

SUNDAY, JUNE 25

3:30 p.m.—Song service for children in grand salon.

7:30 p.m.—Address by J. A. McGowan, secretary - treasurer Terre Haute, Indianapolis & Eastern Traction Company.

TUESDAY, JUNE 27

9:30 a.m.—Meeting of directors of the Engineering Council.

10:30 a.m.—Meeting of the executive committee.

2:30 p.m.—Committee reports as follows:

"Auto Transportation," by Zenas W. Carter, the White Company, Long Island City, N. Y., followed by discussion.

"The Weekly Pass," by S. W. Greenland, vice-president and general manager Indiana Service Corporation, Fort Wayne, Ind., followed by discussion.

"Development of Interurban Freight," by Bert Weedon, traffic manager Interstate Public Service Company, Indianapolis, Ind., followed by discussion.

WEDNESDAY, JUNE 28

2:30 p.m.—Program in charge of the Engineering Council, as follows:

Report of the chairman, by Harry Reid, president Interstate Public Service Company, Indianapolis, Ind.

Reports of sectional directors—Eastern section, by P. V. C. See, superintendent equipment Northern Ohio Traction Company, Akron, Ohio; northern section, by E. B. Gunn, superintendent transportation Western Ohio Railway, Wapakoneta, Ohio; western section, by A. Schlesinger, superintendent substations and distribution Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.; southern section, by W. A. Coleman, superintendent and master mechanic Dayton & Western Traction Company, Dayton, Ohio.

"Current Saving Devices on Cars," by Frank H. Miller, vice-president Louisville Railway, Louisville, Ky., followed by discussion.

"Metals for Car and Power House Bearings," by H. H. Buckman, United Lead Company, New York City, followed by discussion.

THURSDAY, JUNE 29

2:30 p.m.—"Gear Economies Through New Tooth Shapes," by E. S. Sawtelle, assistant general manager the Tool Steel Gear & Pinion Company, Cincinnati, Ohio, followed by discussion; "Light-Weight Interurban Cars," by F. E. Wynne, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., followed by discussion; "Comments on Car Ventilation," by W. McK. White, president White Manufacturing Company, Goshen, Ind., followed by discussion.

Recent Happenings in Great Britain

Peace in the Tramway Industry — Company Buses and Municipal Tramways—Track Renewal Troubles

(From Our British News Representative)

THE National Joint Council for the tramway industry has been informed that the new agreement as to working hours, particulars of which I gave a month ago, has been accepted by the parties concerned. There was no dissentient among the municipal tramway authorities, and a conference of tramway companies had recommended the adoption of the agreement. The employees by a majority had also accepted it. There is thus now no general matter in dispute between employers and employed in the British tramway field, though of course local disputes may arise from time to time. The National Joint Council is to be congratulated on the result of its efforts.

Tramways Association Considers Buses

It may be recalled that some time ago the Municipal Tramways Association became concerned over a power evidently given by the Roads Act, 1920, to the Minister of Transport to authorize companies to run buses against the wish of municipalities and it might be in competition with municipal tramways. A case in point is now reported from Newport, Monmouthshire. The Town Council there works a tramway, while a company called the South Wales Commercial Motors, Ltd., runs buses between Newport and Chepstow, a distance of 20 miles. The company applied to the Council for licenses to run buses within the borough of Newport, and the Council refused to grant the licenses. The company, thereupon, under the Roads Act, appealed to the Ministry of Transport. After the Minister had considered the case, he informed the Town Council that he was of the opinion that reasons given by the Council did not justify its decision to refuse to grant licenses to the company to run its interurban bus service into the center of the borough. The Minister considered that the licenses should be granted on conditions and that the Council should issue the licenses.

Cost of Living Index Down

It would appear the company has a good case for the limited service proposed within the borough. In other towns in England a similar arrangement exists, and the Town Councils can, if they think it necessary, protect their local tramway services by providing that the buses shall charge higher fares than the tramcars for journeys begun and ended inside the borough, or that there should be no picking up by the buses in the borough on the inward journey and no setting down on the outward.

In consequence of a further fall in the cost of living index figure to 82 per cent above August, 1914, British tramway employees in the beginning of May suffered a further reduction in wages of 2s. a week, making the total reduction from the peak limit 10s. a week.

The Manchester City Council has approved a recommendation by the tramway committee for a reduction of fares by increasing the length of the penny stages from 1¼ miles to 1½ miles. This is a reversion to the charges before the last increase was made, and for the present is regarded as experimental only.

The Wolverhampton municipal point of view as to reductions in fares is interesting. The Town Council has agreed to reduce the present 2d. minimum tramway fare to 1½d., though the manager estimates that the retention of the 2d. minimum would produce a credit balance of £8,438 and that the substitution of the 1½d. minimum will result in a deficit of £3,562. The reason advanced for reducing the fare is the over-riding necessity to make every possible contribution to a furthur fall in the cost of living.

Track Renewals a Problem

The Town Council of Croyden is in difficulties over the question of the renewal of its tramway tracks, which are badly worn. Croyden is a large borough lying to the south of London and there are buildings practically all the way between the metropolis and Croydon. The main London and Brighton public road passes through the borough and forms the main street in it, along which the principal tramway route runs, and is continued south to Purley. The London County Council Tramways extend as far south as the northern end of the Croydon tramways. Along this great thoroughfare there is a large traffic of buses and other heavy automobiles which help to wear out the tramway tracks.

The Town Council recently received a report on its tramway undertaking by James Dalrymple, general manger of Glasgow Corporation Tramways, and R. J. Howley, M. Inst. C. E. The report states that to reconstruct the present system and to continue to work it as hitherto would result in a net loss to the rate payers of about £18,000 a year. They cannot recommend railless trolley buses as suitable to the conditions. Motor bus powers within the borough would only be useful in substitution of local services which are reasonably profitable. They do not think powers cou'd be obtained to work buses outside the borough. The tramway service through Croydon to Purley should be a through service from London and could best be given by the London County Council Tramways. Should this arrangement be carried out, the suggestion is made that the Town Council close its undertakings and arrange for the working of the local services by the London County Council or the South Metropolitan Tramways. Should through running not be arranged with the London County Council, it is suggested that negotiations be opened with the London Underground group to provide an adequate service of buses between London and Purley, the local services to be worked by the South Metropolitan Company. Any arrangement should be on the basis that the rental paid should free the Council from cost in respect of maintenance and capital charges. Under different schemes, deficits on working are estimated.

Tenders Invited for Tramway Material

For the purpose of obtaining certain classes of tramway stores, materials, etc., the practice of the highways committee of the London County Council is to invite tenders from selected firms. In this connection the committee has announced that it will not at present include the names of foreign firms in the selected lists of tenders. In cases, however, where there is reasonable ground for believing the tenders are not being submitted on an independent basis and that advantage is being taken of the limitation to British firms, the committee will not hesitate to invite tenders by advertisement. In that case foreign firms will be at liberty to tender equally with British firms.

The Leeds City Tramways, though a large and well managed undertaking, is not yet restored to a very prosperous condition. The total revenue for the year ended March 31 last was £959,703, being a decrease of £35,934 compared with the previous year. As there was a reduction in the mileage run, however, the receipts per car mile of 24.695d. showed an improvement of 1.215d. per car mile. The working expenses were £702.250, being a decrease of £27,095. Thus the gross surplus was less than £9 000. The working expenses equaled 18.07d. per car mile, an increase of 0.87d. After allowing for capital charges, income tax, permanent way renewals, etc., there was a deficit of £43,266, against a surplus in the previous year of £5,622.

Directors Recommend 5 per Cent Dividend

The report of the directors of the English Electric Company for 1921 shows that the net profits were £317,423. After deducting preference dividend and interest, there remains an available balance of £168.852. The directors recommended a transfer to reserve of £60.000 and a dividend on the ordinary shares of 5 per cent (less tax), leaving £55.599 to be carried forward. A year ago the dividend on the ordinary shares was 8 per cent.

PERSONAL MENTION

Strike a Political Issue

Men in Employ of New Brunswick Power Company Carry Their Fight Against Road to the Public

Strikes that continue for a year are unusual. There has been one up at St. John, N. B., that has extended almost this long. This is true, however, only technically, for so far as the New Brunswick Power Company is concerned the effort of the employees to tie up operations failed and has become a thing of the past. The strike remains as an issue in political circles, however. It is for this reason alone that a recital of the facts is of interest.

About a year ago the New Brunswick Power Company announced its intention of converting the rolling stock for one-man operation. The motormen and conductors protested. The case was taken before the City Council by the union among the railway men, but the Council after an inspection of the rolling stock decided not to forbid the conversion of the cars and their operation by one man.

Official Remains Firm in Stand

The motormen and conductors threatened to strike if the one-man cars were placed in operation. General Manager Thomson remained firm in his determination to operate one-man cars and instructed employees who were unwilling to operate such cars to turn in all paraphernalia belonging to the company. The carhouse was placed under guard and no motorman or conductor was permitted on the property unless he was willing to operate a one-man car. This, however, was not the only issue involved in the controversy. On June 4 the agreement of the company with the union expired. The company gave the usual thirty days' notice that it did not intend to renew the agreement. Numerous consultations and meetings were held in an effort to institute a working agreement, but all of these failed. The company desired to reduce wages from 10 to 20 per cent. This phase of the controversy was referred to in the Electric Railway Journal for Aug. 6, 1921, page 217.

The company styled the situation a strike and the men termed it a lockout. Anyway, cars were not operated for a week. In a few days many jitneys were in operation in St. John and in the suburbs.

Jitney Company Organized in Opposition

Several of the old motormen and conductors remained at work and in a week service was restored on the railway. Traffic fell off to practically nothing. The former railway employees, reinforced by men employed at the power plants, gas works and in the maintenance department, all of whom also went out, organized a jitney company. Sixteen trucks were bought and placed in operation on lines paralleling the railway, but the rigorous northern winter soon created havoc with the trucks.

Meanwhile traffic on the street railway had started to improve and by Jan. 1 it was back to normal. For the most part the men imported from Montreal and Toronto and from near-by towns were being used to operate the cars, although about fifteen of the strikers returned to work.

The strikers are still very active against the company. When the company sought to gain control of the hydro-electric current from the new station at Musquash, erected by the Provincial Government, the former employees fought this strongly. At the polls Mayor E. H. Schofield, who advocated handing over the distribution of the current in St. John to the company for a period of at least two years, was badly beaten recently by H. R. McLellan, who advocated civic distribution of the current from Musquash. The striking motormen and conductors worked for many months to defeat the efforts of the power company.

High Scale Being Demanded

Electric railway employees of the tricities, Davenport, Iowa, and Rock Island and Moline, Ill., are asking a top scale of 68 cents an hour as the new rate to take effect on June 1, when the present contract expires. The top scale is now 55 cents an hour and the operation in the tricities is entirely under the one-man system. It is reported that the Tri-City Railway will refuse to pay the increase demanded and will insist on a reduction of at least 5 cents an hour. The respective plans of the two sides in regard to the new scale, however, have not interrupted friendly relations and both sides are confident of arriving at an agreement without a break in negotiations. So far minor working conditions have been considered.

Negotiations are being conducted separately with the men of Illinois and with the men from the Iowa lines. The scale and the working conditions, however, will be identical. The men at first asked for a five-year contract, urging that the reopening of the wage question annually would do neither side any good and suggesting that a long term agreement would be most satisfactory to each. This demand has been refused by the Tri-City Railway, which will insist on holding to the old contract length, one year.

James Forrest Lecture

Whole Field of British Transport Is Covered by Sir John Aspinall Before Civil Engineers

Sir John Aspinall, formerly engineer and general manager of the Lancashire & Yorkshire Railway, on May 2 delivered the annual "James Forrest" lecture in connection with the Institution of Civil Engineers. In this he ranged over the whole field of British transport, and also made references to other countries, and dealt largely with conditions of steam railway workings and traffic.

In reference to the forthcoming amalgamation (under the provisions of the Railways Act) of the London & South Western, the London, Brighton & South Coast and the South Eastern & Chatham Railways, he made an interesting suggestion as regards Waterloo Station, the London terminus of the London & South Western Railway, which is used both by the long-distance steam trains and by the suburban electric trains. He said that this station could be made the point of departure and arrival for Continental services of the three railways, provided that the electric services now running into the station could be accommodated elsewhere.

It was very generally admitted that these local services would be much better dealt with by an arrangement of lines ending in a loop, so that there would be no crossing of incoming and outgoing trains. In regard to the extension of electric working to main line traffic, he had no hesitation in saying that there were numerous cases in Britain where expenditure under this head would be found most remunerative, especially for traffic transporting goods.

In reference to the question of traffic in London Sir John said that notwithstanding the great capacity for handling traffic possessed by the most modern omnibuses, mainly over very short distances, the extension of railway facilities for London was an urgent necessity.

The capacity of a tube train carrying 400 or 500 people, with such trains succeeding one another at intervals of about 1½ minutes, was required to deal with the rush of travelers morning and evening, most of whom were showing more and more desire to get well out of London.

He would not despair of some first-rate scheme being adopted for future gradual development, if it were in the first instance considered by a strong committee of those engaged in handling London traffic, and then legalized with a view to its being financed and carried out in sections.

Dishonest Conductors Caught

Device in Fare Box Traps Conductors Who Are Caught in the Act of Stealing

Two conductors on the Municipal Railway, San Francisco, Cal., who were suspected of stealing from fare boxes were recently caught red-handed in a trap set by officials of the road. The trap involved the use of a device placed in the fare box in such a way that once the box was opened it could not be reassembled. Both men pleaded guilty and told how details of the plan, involving other conductors and a car dispatcher, were arranged and carried out.

The original suggestion of dishonesty, it is alleged, came from the dispatcher. He is said to have recommended to two conductors assigned to the last runs at night that they leave money in the fare box above the registering device when turning in the fare boxes at the end of their runs. This money would not show on the register and could be taken by the dispatcher when he made his nightly round of inspection to remove from the fare boxes the pennies, etc., that would not go through the registering device.

METHOD EXPLAINED

After collusion on this score the conductors felt that the dispatcher would not dare to expose them for tampering with the fare box seals and proceeded to take money themselves. To avoid detection in this they allowed coins to accumulate in the fare box above the registering device, whence they removed them at the outer ends of their run after forcing open the boxes.

The fare boxes used on this system are of the type in which the interior of the box is accessible when the bolt which holds the mechanism in place is removed. This bolt is fastened with a lead seal impressed on twisted wires. After forcing this seal off the wires with pincers the conductor opened the box, removed the cash and after putting the box together again pinched the same lead seal back on the wires.

The two conductors were in the habit of doing this once each night immediately after the evening rush hour and at the end of the line, where there were ordinarily no passengers on the car. Except for this rush hour defalcation, other fares going into the box were registered by turning the handle as usual. In making their daily reports at the carhouse the men arranged their records so the fares which they had actually registered were distributed over all trips in accordance with the usual traffic variations, thus making it possible for each man to take several dollars a day without making any suspicious entry in the trip records.

The trap set to catch the dishonest conductors consisted of a pair of lugs attached to the inside of the fare box in such a way that when the bolt was removed the lugs sprung into the bolt's passage-way and prevented its being returned to place in the usual manner. When the trap was set both men were caught in the act on the same evening, both pleaded guilty and were given suspended sentences of six months. It was not considered worth while to prosecute the case against the other employees involved and they were simply discharged.

The plan of detection was devised by the superintendent of the San Francisco Municipal Railway, who personally apprehended the conductors. The master mechanic developed the device which was used as a trap in the fare box.

Philadelphia Wages Cut

The Philadelphia (Pa.) Rapid Transit Company has announced a new maximum wage rate, effective June 1, of 62½ cents an hour for surface motormen and conductors. This is a reduction of 1½ cents an hour, the present rate being 64 cents. Elevated railway motormen and guards are also reduced and way department and shop men are cut 1 cent an hour. The co-operative plan for collective bargaining of the Philadelphia Rapid Transit Company provides as a basis for determining wages the average of wage scales of street railway companies in Chicago, Detroit, Cleveland and Buffalo. The present reduction on Philadelphia Rapid Transit lines is in conformity with the wage decrease of the Cleveland Railway.

Wage Matter Goes to Arbitration

An agreement was signed at New Haven, Conn., on May 29 submitting to arbitration the wage differences of the Connecticut Company trolley men with the company. Judge J. K. Beach, Joseph F. Berry, counsel for the Connecticut Company, and James H. Vahey, Boston, representing the trolley men, will constitute the arbitration board. Officers of the local association of the trolley men's union have expressed satisfaction over the personnel of the board. At present, men employed more than one year by the company receive a maximum of 55 cents an hour and the new scale offered by the company, but rejected by a heavy vote, calls for a scale of 50 cents.

Wage Scale Will Continue

The current wage scale of Evansville, Ind., street car and interurban motormen and conductors will be continued for the year beginning June 1, according to announcement of officials of the Southern Indiana Gas & Electric Company. The scale for two-man city cars in cents per hour is as follows:

First six months	36
Second six months	37
Second year	38
Third year	39
Fourth year	40
Fifth year	41

Operators of one-man city cars 4 cents an hour additional.

Interurban conductors and motormen, 2 cents an hour more than two-man city scale.

The current agreement, which was negotiated last year, represents a reduction of 9 cents an hour from the wartime peak.

Relief Sought from Paving

Officials of Charleston Property Claim Paving Obligations Unfair—Railway Not Making Expenses

The City Council of Charleston, S. C., has been asked by the Charleston Consolidated Railway & Lighting Company to be relieved of that part of its franchise which requires the corporation to pave between its tracks and for 3 ft. on each side. It is contended that the conditions which caused this provision have changed and that it is no longer fair for a railway to be required to pay such a heavy toll.

The petition recites that although the railway during 1921 failed by $29,820 to meet its operating expenses, it paid in city and county taxes the sum of $44,875 and that, in spite of discouraging conditions, the corporation strived to improve its equipment. It is recited that the recent Meeting Street paving improvements cost the company $99,300, $41,500 for the paving and $57,800 for roadway improvement made necessary by the paving.

The company says that a forecast of the future indicates that the operations of the year 1922 will result in an operating loss, due not so much to temporary business depression as to the actual decrease in the number of riders, occasioned by the large number of private automobiles.

It is explained that while the company is in thorough accord with the improvement program now being carried on, it finds itself in an unfortunate position, in that the proposed improvement involves the expenditure, and consequent future financing, of an amount conservatively estimated at $358,000 by a railway which is not making its operating expenses—an expenditure which will in no way increase its operating revenues, but will entail an indebtedness and fixed charge of that sum on the company.

ACTUAL PAVING COST $237,000

Of this sum $237,000 is the estimated cost of the actual paving, while the remaining $121,000 represents the lowest possible cost of preparing the roadways for paving, assuming that the company utilizes all the existing rails and materials now in reasonably good shape. This paving charge provides paving a second time streets in which there now exists paving paid for by the company in the amount of $73,094.

The company says that the petition is made in the hope that there may be worked out an equitable situation under which it can continue, in these changing times, not only to render service to the people of Charleston but to meet the demand for extended facilities and improved service which will be made upon it as the city grows and develops.

In asking earnest consideration of the petition, the company says it stands ready to furnish the city with any facts or figures at its command in regard to railway operation.

Railway Experiments With Radio Telephone

Possibility of using the radio telephone so that the crew of a traction car equipped with a standard wireless set may be in constant communication with the dispatcher while standing or running has been demonstrated by Fred C. Manson, superintendent of distribution of the Monongahela Power & Railway Company, Fairmont, W. Va. Experiments made indicate that it is possible to use the trolley wire for the antenna, or to employ the system termed "wired wireless." Mr. Manson declares that he has carried his experiments far enough to believe that it is now possible to equip cars with standard sets, augmented by some special apparatus, and make continuous communication practical.

"Co-operative Courtesy, Mutual Helpfulness Will Improve Service"

"The Wayfarer and the Fare" should be an inspiration to every employee of the Grand Rapids (Mich.) Railway. It is an attractive fifteen page booklet—the work of L. J. DeLamarter, vice-president and general manager of the Grand Rapids Railway. It emphasizes and brings home to every employee his responsibility in the successful operation of the railway—selling a real service. He tells the men not to add to the problem of the company by giving a wrong impression regarding the company's aims. In part he says:

> If you cannot get "in tune" with the street railway company, if you are not in sympathy with it, you do yourself a great injustice by remaining on its pay roll. The money you receive for services which you cannot render with a free will and whole heart will never do you any good.

Cheerfulness in the performance of duty he considers of utmost importance in increasing the number of friends for the company and for the men themselves. In conclusion he says:

> No matter what your philosophy may be, or how you regard the public or your particular position in the Grand Rapids Railway, let us all unite on our motto and keep it before ourselves and those we aim to serve and agree with Lincoln that "angels can do no more."

No Referendum on Akron Grant

The City Council of Akron, Ohio, on May 23 rejected the ordinance calling for a referendum vote on the two-year 5-cent fare franchise recently granted to the Northern Ohio Traction & Light Company. City Law Director H. M. Hagelbarger explained to Council that through a mistake of the city legal department it had been publicly announced that following Council's decision on May 23 the citizens of Akron would themselves have thirty days more in which to circulate referendum petitions if they desired. He said that a supreme court decision bearing on the case requires popular referendum petitions to be circulated in accordance with the state constitution instead of under city charter rules. The state law stipulates that the petitions, which in this case must carry 4,000 names must be filed with the council clerk within thirty days after the passage of the ordinance upon which the vote is to be taken. This thirty-day period has already expired.

Get-Acquainted Gathering

On April 20 the East St. Louis (Ill.) Railway held a "get-acquainted gathering" on the fourth floor of the office building. In addition to department heads and transportation supervisors W. H. Sawyer, president of the company, sent an invitation to all conductors and motormen personally commended by him during the year. All the men in the company who were invited were requested to bring with them some member of their family or some particular friend. An entertainment started promptly at 8 o'clock, but Mr. Sawyer expressed the hope that the men would be able to get there before that time so that he might have the opportunity of personally welcoming them.

Radio May Make Possible More Efficient Use of Line Crews

Rather successful experimenting has been done by H. M. Gould, electrical engineer Department of Street Railways, Detroit, Mich., looking toward the possibility of equipping line cars and trucks with radio receiving sets so that the main office may keep in communication with the crews.

The study is being made because of the obvious advantage of being able to utilize the spare time of emergency crews for doing maintenance work. A Ford truck equipped for emergency line work was used to determine the possibilities of applying radio. It was fitted with an aerial 4 ft. square which worked most effectively when placed flat over the top of the truck roof. This aerial or antenna was made up of 500 ft. of No. 14 bare copper wire with the turns spaced about $\frac{1}{2}$ in. apart over the plane of the square. It was connected to the set by four taps taken off the aerial at equally distant points and connected in parallel. The frame of the truck was used as the counterpoise. The set comprised a two-stage amplifier with regenerative circuit, employing three "radiotron" UV-201 G. E. tubes. This set was built by L. R. Wagner, assistant engineer.

It was found possible to communicate with the line crew when 7 miles from the sending station. The set was found to be very noisy when the truck stood under the trolley wire or under the 23,000-volt a.c. line, though the interference was less under the latter than under the trolley line. Despite this noise in the receivers it was entirely possible to communicate orders to the crew. The problem of broadcasting orders was solved in this case by the offer of the Detroit *News* to broadcast the message. The *News*, according to the law, ceases its news broadcasting for 2 minutes every 15 minutes and it was during these intervals that orders to the crew were transmitted, during the experiments.

Announces Petition for Rehearing Taxpayers' Case

Further interpretation of the Supreme Court's recent decision in the Fourteen Taxpayers case, to determine the status of tax-supported departments which perform work for the Seattle (Wash.) Municipal Street Railway, will be sought in a petition for a rehearing of the case, Corporation Counsel Walter F. Meier announces. The statement came in a legal opinion Mr. Meier gave to Chairman Oliver F. Erickson of the council utilities committee, regarding the segregation of accounts of the law, accounting and purchasing departments as to expenditures made in behalf of the street railway. Until a further interpretation of the court's meaning is obtained Mr. Meier said, he takes the view that the city is not enjoined from paying for the railway's legal, accounting and purchasing work out of the general fund.

Mr. Erickson's request for an opinion arose out of Mayor Hugh M. Caldwell's announcement that unless the expenditures of the tax-supported departments for the railway are segregated so that they may be paid out of the railway receipts, he will not approve the salary and appropriation ordinances for the May 25 disbursements.

Court Reduces Chicago Fare

The Federal District Court on June 1 ordered a reduction in fare on the Chicago Surface Lines from 8 cents to 7 cents cash, or three tickets for 20 cents, effective June 15. No detail decision giving reasons for the action was rendered. A formal order is to be issued later.

The three judges sitting on the appeal were not unanimous in granting the interlocutory injunction against the 6-cent fare ordered by the Illinois Commerce Commission. Judge Geiger held that the injunction should not be granted, which presumably means that he did not consider a 6-cent fare confiscatory. Judges Page and Evans favored the injunction only on condition that the fare be made 7 cents with the reduced ticket rate. The question of a permanent injunction will be next in order before the court. Attorneys for both the city and railway hold that the Federal Court had no power to fix rates. The sequence of events has been a 5-cent fare order, enjoined by the court; a rehearing and a new order for 6 cents, with a new appeal by the company.

Wage Conferences Started.—Negotiations have begun between the Berkshire (Mass.) Street Railway and its employees relative to a new wage schedule to replace the present scale expiring June 1. The pay is now 53 cents an hour for a nine-hour day. It is stated the men seek an increase, while the company desires to reduce the rate. A year ago a reduction of 10 per cent was instituted.

Service-at-Cost Grant Held to Be Illegal

The Third District Court of Appeals on May 22 reversed the judgment of the Common Pleas Court which had held legal the year-old service-at-cost franchise in Findlay, Ohio.

The new grant, passed in February, 1921, increased fare and relieved the Toledo, Bowling Green & Southern Traction Company from paving between its tracks.

Attorney George H. Phelps attacked the new grant on the ground that Council exceeded its authority in creating a railway commission named by the Mayor, which regulates service and supervises the system finance. The company's counsel announced that the case will be appealed immediately to the Ohio Supreme Court.

The service-at-cost franchise in Findlay, which the court held to be illegal, was contested on the ground that it conflicted with Section 3771 of the state code. This section forbids city councils to relieve street railway companies of any of the obligations under existing franchises.

The Findlay service-at-cost franchise, adopted in 1919, had been superimposed on one granted in 1915, which was for a term of twenty-five years.

Under the 1915 Findlay franchise the company had been obligated to provide a 5-cent fare and to relay paving between the tracks. The street railway commission of three, established under the new franchise, had allowed the fare to be increased to 10 cents cash or seven tickets for 50 cents.

These acts of the Street Railway Commission were held to relieve the street railway company of its original franchise obligations and the court declared the Tayler mode of procedure, as applied to Findlay, illegal.

Announces Wage Reduction of 12½ per Cent

The Board of Conciliation and Investigation, appointed under the Industrial Disputes Act of Canada in April, 1922, to investigate a dispute as to wages between the Ottawa Electric Railway and some of its employees, who are members of Division 279 of the Amalgamated Association of Street Railway Employees, has made its report. The board has recommended a general reduction of 12½ per cent in wages and a continuance of the nine-hour day, leaving other working conditions as before. This award has been accepted by the company.

At a mass meeting held on May 27 the men rejected the award, but this rejection apparently amounts to accepting it under protest as there is no word of any further action on their part.

The company on May 29 announced by bulletin the reduced scale of wages which for carmen is 43, 45, 46 and 48 cents an hour for first, second, third and fourth year service. This represents a reduction of 7 cents an hour on the old rates. A general reduction of 12½ per cent has been put into effect in the other departments.

Real Estate Association to Aid Trolley Fare Cut

The California Real Estate Association through its transportation committee has definitely decided to back an initiative amendment to the California State Constitution. In a statement issued by Guy W. Wolf, director of research for the association, it was shown that the "electric railways affected have given assurance that if they are relieved of some of the burdens of highway construction and maintenance they can operate at reduced fares and at a profit. Under these conditions California cities and towns can secure transportation they need and which they are unable to get so long as present conditions continue."

It was brought out in the statement that this proposed amendment is of direct importance to every real estate operator and property owner and that improvements and extensions in electric railway service will mean not only increased business but will also add to the assessment roll of the communities affected as will result in materially decreased taxes.

Railway Employees Make 100 per Cent Showing in Basketball

The basketball team representing the shops of the Reading Transit & Light Company, Reading, Pa., recently closed a successful season. Twenty-seven games were played and nineteen of them resulted in victories for the Reading Transit & Light shopmen, who scored 774 points to a total of 664 for their opponents. The latter included some of the strongest semi-professional clubs in Reading and vicinity, where basketball is an unusually popular sport.

It was the first season for the mechanical men on the basketball court, and they were late in starting. Most of the eight games that were lost were played early in the schedule, before the players had gained experience. All workers in the shops were invited to try for positions, and those who did not make the team were generous in supporting it. At the close of the season the members of the team were the guests of their fellow-workers at a banquet to celebrate their good record.

Home games were played every Thursday night in the large recreation hall provided for Reading Transit & Light Company employees. There was always a large attendance. A number of contests were also played in nearby towns reached by interurban car lines.

The team was made up of L. Heere and R. Whitman, forwards; L. Shrope and W. Dillon, centers; Captain Bierbower, Beyerle, Madara and C. Meyer, guards; and H. E. Aldrich, manager. The line-up will be unchanged next year.

News Notes

Appointment Made.—It was recently announced that Homer Loring, chairman of the trustees of the Eastern Massachusetts Street Raliway, has been appointed chairman of the transportation committee of the Boston Chamber of Commerce. The place was formerly held by Stanley King, who resigned.

City Seeks Suit Dismissal.—The city of New York in answer to the $30,000,000 suit of the Brooklyn Rapid Transit Company for alleged failure to carry out obligations of the subway contract has sought a dismissal of the suit. The city charges the company with failure to carry out the contract and scores the company's poor service and equipment.

D. U. R. Offices Being Removed.—The general offices of the Detroit (Mich.) United Railway and allied companies are in the course of removal from the Detroit Interurban Building, Detroit, to new quarters in Traction Building, at Third and La Belle Avenues, Highland Park, Mich. The Interurban Station, Detroit, will remain at its present location.

Rules Merger Is Legal.—The District of Columbia Commissioners have transmitted to Congressional committees considering the proposed merger of the two street railway companies in Washington, an opinion of Corporation Counsel F. H. Stephens to the effect that the companies have under existing law the power to merge. The Public Utilities Commission of the District has concurred in the opinion. There had been dispute as to whether there was sufficient authority under present law to permit the merger.

New Publication Needs a Name.—With the temporary title of *Wanted a Name?* the forty-page monthly magazine of the Market Street Railways has been introduced to employees of the company, "of, by and for" whom it is published. F. J. Linforth is editor, and Charles C. Stech associate editor. Because the purpose of the magazine, as the first editorial states, is to make the co-workers better known to each other, a large part of the issue is devoted to departmental and division news. The first issue bears a March date line.

Bonus Goes to Many Men.—The results of the first month of the bonus plan for employees of the Georgia Railway & Power Company, Atlanta, Ga., were very gratifying to the management. There were 564 trainmen who succeeded in having a no-accident record for the month of April as well as a month without any infringement of company rules against their names, and to them a bonus of $3 was awarded. The purpose of the bonus primarily is to stimulate motormen and conductors to 100 per cent in carefulness in order to avert accidents.

Financial and Corporate

Approves Bond Issue

Community Traction Company Will Repair Streets—Financing Not Completed—Surplus for April Reported

The City Council at Toledo, Ohio, at its last session finally approved a bond issue of $100,000 to provide funds for the repaving of many streets on which street railway improvements to the extent of $750,000 are contemplated this summer. The fund is to take care of the pavement between the rails the cost of which was formerly charged to the railway. Under service-at-cost operation it was a question as to whether the cost of repaving between rails should be borne by the car riders or by the city as a whole and the automobile riders who use that path. Street Railway Commissioner W. E. Cann appeared before Council and its committees several times and finally won his contention that the city as a whole should pay for the cost of the paving between the rails.

The money to be used by the railway for its improvement program, under the terms of the ordinance, will have to be furnished through the sale of the 8 per cent preferred stock of the Community Traction Company. Definite arrangements for this financing have not been made yet, but President Frank R. Coates and the street railway commissioner will probably discuss the matter soon.

At the recent meeting of the board of control of the street railways there was reported a surplus after operations for April amounting to $14,433, which brings the stabilizing fund up to $114,396. The month's credit was an increase of $884 over the previous month. Gross revenue for April amounted to $304,306 as compared with gross revenue of $307,827 for the month of March. The ratio of operating expenses to gross revenue was 68.429 per cent, which is an improvement over the previous month's ratio of 69.405 per cent. Total passengers carried during April fell off 390,473 as compared with March to a total of 5,322,832 passengers. Despite the decrease in riding a surplus was shown as compared with a deficit of $72,730 for the same month last year. Interest earned on retired bonds amounted to $745 for the month. This was added to the sinking fund.

Street railway board members believe that the increasing number of automobiles and the growing tendency to pick up riders is causing a loss in passengers to the street cars.

The industrial position of the city has greatly improved during the last two months and there are indications that more workers are riding the street cars but in other lines the patronage has fallen off.

One-man cars are to be placed on the Bancroft line for experimental purposes.

Railway Operating at Loss

According to figures filed with the Railroad Commission of Wisconsin the Superior division of the Duluth Street Railway is again operating at a loss. The deficit for the month of February amounted to $1,601. After the 6-cent fare became effective on Sept. 1, 1921, the property began to show a slight profit over operating expenses, but officials attribute the falling down again in part to the general depression and to automobile competition. When the commission fixed a 6-cent fare in Superior it was estimated that it was the fare required to yield an operating income of $76,560 a year, which was held a reasonable return on the valuation fixed by the commission.

Accidents Decrease in Pennsylvania

The Bureau of Accidents of the Public Service Commission of Pennsylvania has compiled some interesting statistics on the number, distribution and causes of accidents in the State of Pennsylvania for the year 1921 in comparison with 1920. Accident prevention campaigns and safety first propaganda were no doubt instrumental in reducing total number of accidents from 2,311 in 1920 to 1,676 in 1921. The accompanying table presents the story in detail.

City Council Will Pay $18,000 to Complete Valuation

The Minneapolis City Council has agreed to pay Delos F. Wilcox $18,000 to complete valuation of the Minneapolis Street Railway property, which will make the total $136,000. He will also testify before the Railroad & Warehouse Commission of the state when that body takes up the hearing on the valuation preparatory to fixing a reasonable fare, which is now 6 cents, while Dr. Wilcox and the city attorney, Neil M. Cronin, are under Council instruction to get a 5-cent fare rate, or as much less as the valuation of the property and returns thereon will justify. Of this $18,000, $10,300 came from the bond appraisal fund, $500 from the street railway inspection account of the current expense fund, and the $7,200 was referred to the ways and means committee to raise. In 1921 the city expended about $4,000 city funds on the valuation and $57,000 was provided by the street railway. The company will furnish $57 000 of the amount to be expended this year and the city the remainder.

Statement Shows Improved Financial Condition

For the twelve months ended Dec. 31, 1921, the report of the Hudson & Manhattan Railroad, New York, N. Y., shows total railway revenues amounting to $7,683,662, against $6,838,269 in 1920. The surplus after bond interest adjustments was $331,823, against a deficit for the year 1920 of $1,058,369. The report to the stockholders states that the continued growth of traffic necessitated additional cars. An order for twenty-five new cars was p'aced on Dec. 31, 1921. They are to be delivered during the early fall of the current year. The cost of the new cars will be $515,000, or $200,000 less than the cost of the same number purchased in 1920.

Railway Corporation Will Pay Heavy Tax

Street railway corporations and gas and electric light corporations of New Jersey will pay a total tax for the present year of $3,167,745 on their gross receipts. The tax takes the place of a personal property tax. The total for this year is an increase of $285,955 over the 1921 tax. It was levied against eighteen street railway companies and seventy-three gas and electric light corporations. It is entirely distinct from the franchise tax levied on the gross receipts of all utility corporations at the rate of 5 per cent for those companies having over $50,000 gross receipts and 2 per cent for those having less than $50,000 gross receipts. Of the total tax, $2,584,549 will be paid by the Public Service Corporation. The Public Service Railway will pay $911,238.

Small Surplus Realized

The report of the Christchurch Tramways, Christchurch, New Zealand, for the year ended March 31, 1921, shows a credit balance of £885 plus, small, in view of the total earnings from operations, which amounted to £251,354. The number of passengers carried for the year ended March 31, 1921, was 24,592,998, against 25,973,655 passengers for the same period in 1920. The report of Chairman Barr reviews the general improvement work undertaken by the company during this period. Contracts were let for fifteen new electric cars and ten new trailers were put on the road. A considerable amount of renewal work was undertaken and completed during the year, the most important being a renewal of main tracks in Cathedral Square.

The report makes mention of the amicable relations with the tramway union and states that the various matters during the year dealt with by the joint committee representing the union and the board produced satisfactory results.

Havana Property Reports

In his annual report on the operations of the Havana Electric Railway, Light & Power Company, Havana, Cuba, F. Steinhart, president and general manager, states that the railway department during 1921 enjoyed a considerable increase of business. The total number of passengers carried showed an increase of 19.8 per cent over 1920 and the passenger earnings increased from $4,850,969 in 1920 to $5,813,646 in 1921, or the same increase in percentage as the number of passengers increased. The total operating expenses increased from $3,454,057 in 1920 to $4,197,911 in 1921. On this point the general manager points out that as the year advanced coal and other commodities became available at lower prices and then labor costs began to go down, so that although the operating expenses for the year were more than 70 per cent of the total earnings, the highest proportion ever attained, the ratio in December had fallen to 61.39 per cent. The net earnings from railway operation showed an increase of $170,022 over 1920, the figure in that year being $1,625,677.

The average number of employees during the year was 4,343 and the management reported that the unrest among wage earners referred to in the 1920 report had disappeared and that throughout the year there was a complete absence of labor disputes.

Fifty-three new cars were delivered to the transportation department during 1921 and much construction work for other departments was supervised and directed.

Nearly $8,000,000 in Salaries and Wages Paid

In the annual report of the Connecticut Company, New Haven, Conn., published in the ELECTRIC RAILWAY JOURNAL, issue of May 13, it is noted that a total of $7,839,770 was paid in salaries and wages during the year to 4,436 employees. The report shows that there are sixteen general officers and 316 general office clerks. There are seventy-six maintenance of way superintendents and 523 employees in this department, while in the equipment department there are eleven superintendents and 254 employees. In the power department there is a superintendent and 230 employees, while the transportation division has 151 heads of divisions and other operating officers and 2,858 employees.

On the subject of stock and the company's liability the report states that the total par value of the authorized common stock is $40,000,000 with 400,000 shares outstanding, divided among the six stockholders who are the federal trustees appointed by the government and President Lucius S. Storrs. The terms of the trustees were to expire on March 4, 1922, or when their successors were elected.

The company has a contingent liability of $6,848,000, which is the amount outstanding of obligations of the "New Haven" road. These were secured by mortgage on street railway property, previous to the date on which these companies were acquired by the Consolidated Railway and the "New Haven" road and which later became part of the Connecticut Company.

Approval of Merger Sought

Application has been filed with Public Service Commission of Maryland by the Cumberland Edison Power Company to take over the Edison Electric Illuminating Company and the Cumberland Electric Railway. The new company was formed for the purpose of consolidating the railway and illuminating companies. At a meeting of the board of directors Thomas B. Finan was elected president of the new company. John E. Zimmerman, an engineer of national repute, will supervise the operation and development of the property.

Financial News Notes

Abandonment Approved.—The Board of Public Utility Commissioners has issued an order granting permission to the Public Service Railway to abandon service on Main Street, between Benner's Corner and Amboy Avenue, Metuchen, N. J.

Commission Approves Bond Issue.—The Tennessee Railroad Commission has given its permission to the Chattanooga Railway & Light Company to issue bonds to the amount of $682,000. This bond issue is understood to have been authorized in connection with the reorganization of the company referred to previously in these columns.

North American Reports.—For the twelve months ended April 30, 1922, the North American Company and its subsidiaries report a slight decrease in the gross earnings, but with economies in operating expenses producing an increase in net income from operations. The balance at the end of the period for depreciation, dividends and surplus amounted to $7,582,477, an increase of 31.8 per cent over the twelve months ended April 30, 1921.

Republic Property Reports. — The Republic Railway & Light Company and subsidiaries, New York, N. Y., for the twelve months ended April 30, 1922, report gross earnings of $7,198,026, against $8,405,954 for the same period a year ago. Operating expenses and taxes decreased $1,543,983. A balance remained for depreciation, dividends and surplus amounting to $515,447, against $343,239 for the twelve months ended April 30, 1921.

Decrease in Traffic Shown.—The Cincinnati (Ohio) Traction Company carried a total of 9,061,705 passengers during the month of April, according to a report tabulated by W. Jerome Kuertz, Director of Street Railways. In April, 1921, the traction company transported 9,004,163, which shows that the company carried on an average of 1,918 more passengers per day during last month. The total for April, however, is below that for March, when 9,098,342 passengers were conveyed.

Foreclosure Sale Announced.—Under decree of the Court of Common Pleas of Montgomery County, Pa., the Norristown Trust Company will sell at public auction on June 29, 1922, at the Court House at Norristown, all the property described in a certain mortgage executed by the Pottstown & Phoenixville Railway to the Norristown Trust Company, trustee, date June 1, 1912. The property consists of a line of railway from Stowe through the borough of Pottstown, and through Sanatoga Park to Linfield, and other rights and franchises. Included in the sale is the popular Sanatoga Park.

Traffic and Transportation

Seeks Fare Extension

British Columbia Electric Railway Negotiates for Six-Cent Fare Continuation

Fares of the British Columbia Electric Railway, Vancouver, B. C., are again the subject of negotiation, following the rejection by the federal government of Canada of a petition to bring the company under the Railway Commission of the Dominion. The company is now negotiating with the city of Vancouver for an extension of its 6-cent fare permission after June 30 next and negotiations will be conducted with the surrounding municipalities and cities in which the company now operates.

The City Council of Vancouver on May 26 passed a resolution instructing the city attorney to prepare a by-law extending the present fares until either a permanent new franchise is agreed to or, failing that, the provincial government appoints a utility commission or other arbitration tribunal. A committee of four members of the City Council was appointed to draw up terms of a new franchise and report within two weeks.

An unusual term of the resolution was inserted at the instigation of a labor member of the Council calling for the company to maintain the present wage scale during the interim agreement. An attempt may be made to have this incorporated in the permanent franchise but it will not be agreed to by the company, it is said. The British Columbia Electric Railway has agreed in return for the proposed interim agreement to extend its Broadway West line a distance of one mile by Sept. 1. Power and light rates will be subject to negotiation as well as fares. A new franchise was proposed in 1921 but, on being drafted, met with disapproval in the city at large. This led to the company instituting a petition for a dominion charter as a means of obtaining stability. It has maintained that it cannot make extensions until permanency of revenue has been obtained.

Should no agreement be arrived at before June 30, when the present 6-cent fare privilege ends, the company has announced that it would not attempt to operate cars.

Answers Complaint of Skip-Stop and One-Man Car

Attorneys for the International Railway, Buffalo, N. Y., have filed with the Public Service Commission the railway's answer to the complaint of Corporation Counsel R. J. Moore in behalf of the City Council against one-man crew cars and the skip-stop system in operation in Niagara Falls, N. Y. The railway claims that the skip-stop system has provided for the greater convenience of the majority of the traveling public. The answer on the one-man car complaint says that better service is rendered, safer transportation is assured and less expensive operation is effected.

The railway asks that the complaint against this type of car be dismissed and that the commission not only approve of this operation on the two lines specified in the complaint, but also on such other lines in the city of Niagara Falls as the company shall consider advisable.

Galveston Decision Misconstrued —Seven-Cent Fare Necessary in Fort Worth

The Northern Texas Traction Company, Fort Worth, Tex., will not lower its fares in response to the demand made by the city authorities. A reply to this effect has just been sent to the city by George H. Clifford, vice-president and general manager, in reply to a communication from Mayor E. R. Cockrell. The Mayor in his note said:

> In my opinion the 7-cent fare in Fort Worth should be reduced in view of the recent decision of the United States Supreme Court in the Galveston case.

The city of Fort Worth had been delaying its fight for reduced fares pending a decision in the Galveston case and as soon as that case was decided was ready to take up the contest to force the desired reduction.

In reply to Mayor Cockrell, Mr. Clifford declared that the general opinion that the Supreme Court granted a 5-cent fare to Galveston is in error. He asserted that the decision merely set forth a method of ascertaining the proposed valuation, deducting expenses from revenues to arrive at set returns and does not specify a 5-cent rate. He expresses regret that the general opinion is that the Supreme Court set the 5-cent fare as equitable. Mr. Clifford said:

> The Supreme Court merely prescribed a method to be followed by a city to arrive at a proper rate, and the only bearing that decision has on the situation in Fort Worth is to ascertain whether that method has been used in Fort Worth.

The minimum property valuation of the Northern Texas Traction Company in Fort Worth, according to Mr. Clifford, is $7,753,857, while the net revenues during the last year amounted to $251,683, or interest on the investment at the rate of 3.25 per cent.

Mr. Clifford stated that in 1905 there were 24 miles of track in the city and that since that time 51 additional miles have been built, making a total of more than three times the mileage of 1905. Since 1910, he said, the company has spent more than $5,000,000 on improvements.

City Asks Rehearing in Fare Case

A petition has been filed with the United States Circuit Court of Appeals at Cincinnati, Ohio, by Clayton B. Blakey in behalf of the city of Louisville, Ky., asking for rehearing in the city's litigation with the Louisville Railway over 7-cent fares, seeking modification of the injunction granted by Judge Evans and upheld by the higher courts.

Several important points are brought out in the petition which Mr. Blakey said he felt should result in some modification of the injunction that now virtually prevents the city from obtaining any relief through legislation.

The petition for rehearing takes the view that "the vital question in this case concerns the validity of the 5-cent fare embodied in the franchise contracts entered into between the city and railway company since the adoption of the present constitution" in 1891. The United States Circuit Court of Appeals, in upholding Judge Evans, took the view that these franchises were of minor importance.

A second ground urged for rehearing and modification is the form of the temporary injunction. The city says that in view of the court's opinion it may become its desire to abandon its original contention and establish some other rate than 5 or 7 cents, but seems to be prohibited from doing so.

Jitneys Ruled Out

As a result of a recent Supreme Court decision jitney operators of Kansas City, Mo., found violating the restriction ordinance will be arrested, according to an announcement of Mayor Cromwell. The Supreme Court refused to discontinue the injunction issued by the Circuit Court of Kansas City.

A decision was given on April 14 by Judge Nelson E. Johnson of the Circuit Court declaring that the city jitney ordinance was valid, and that the Bestor law did not apply. The city ordinance provided that jitneys could not operate on streets where resident owners of 51 per cent of the property had not consented to their use for the purpose.

F. M. Roberts, head of the jitney men, in a statement said that if the people of Kansas City wanted motor transportation the Common Council and Mayor should be asked to modify the ordinances.

M. A. Fyke, assistant city counselor, who handled the jitney case for the city, said that the Supreme Court ruling would mean the jitneys were barred from all Kansas City streets unless the association can obtain the consent of owners of 51 per cent of the property frontage on the streets over which they operate.

Jitneys as Competitors Barred.—A permanent injunction against operation of jitney buses in those streets of North Little Rock, Ark., where they would compete directly with the cars of the Intercity Terminal Railway has been granted in Chancery court.

Digitized by Google

Earnings Statement Presages Fare Cut

Cleveland car riders may be riding for a 5-cent fare before Sept. 1. That is the statement of the Cleveland (Ohio) Railway officials, as a result of the company's April showing. The company accumulated a surplus of $93,647 in its April operation. This has boosted the interest fund, fare barometer, to $324,158. When this fund reaches $700,000 the fare must automatically be reduced one notch in the rate schedule called for by the franchise. The rate is now 6 cents with a 1-cent charge for transfer. The next lower rate is 5 cents and a 1-cent charge for transfer. The April surplus is the largest earned in many months. Inasmuch as the recent 10 per cent wage reduction for motormen and conductors is effective from May 1, the company's report for May is expected to show even a larger surplus than that of April.

Business conditions have been improving so rapidly that company officials state that if they continue to improve during the summer months, there is little doubt but that, with the saving of $40,000 a month, the fare will be reduced before Sept. 1. A total of 33,498,152 riders was carried by the company in April. This is within 2 per cent of the number that rode in the same month the year previous.

Will Contest Termination of Jitney Agreement

Jitney operators in Spokane, Wash., have decided to contest the clause in the new railway franchise which terminates jitney operation on Jan. 1 of next year. The men base their claim on the ground that it was understood the jitney business was a permanent one when they invested in it. Opposed to this statement was Mayor Fleming, who contends that all jitney operators knew that the future of their business depended on the outcome of the railway situation. Corporation Counsel Geraghty said that he saw no chance for the jitneys to run in opposition to the ruling of the City Commission because twice the Supreme Court had upheld the right of the city to exclude jitneys.

Weekly Pass Plan to Be Continued

As a result of the successful operation of the weekly pass system on the lines of the New Brunswick Power Company, operating the electric railway in St. John, N. B., it is likely that this system will be continued indefinitely. It was started twenty-nine weeks ago.

When the passes were first issued, the holders were notified through advertising in the four daily newspapers of St. John that the system was on trial only and might last only a few weeks. The response to the first issue of passes was somewhat disappointing. During a recent week, however, 3,500 passes were sold.

The passes have stimulated traffic on the road, although the attempt to popularize the pass system through advertising has not been conspicuous or sustained. Just a few local readers were inserted in the newspapers at the start of the pass system, and no advertising has been done since.

The price for the passes is $1 dated from Monday morning to Sunday night. The regular rates are straight 10-cent fare, or three tickets for 25 cents or fourteen tickets for $1. Each week's pass is of different color and with the dates printed in semi-prominent type. The passes are numbered conspicuously covering the entire face, the numbers being taken from the number of weeks the system has been in operation.

The pass has aided the railway company materially in speeding up traffic on the road.

Urges Reduction in Fare

Delos F. Wilcox, valuation expert for the city of Minneapolis, Minn., expects to have his report ready for the Minnesota Railroad & Warehouse Commission in July. In reporting on May 20 to the chairman of the street railway committees of the City Council, Dr. Wilcox intimated that instead of an increase of fare for the Minneapolis Street Railway the question is how much the fare may be reduced. It is now 6 cents and a determination of a proper rate of fare is to be put up to the State Commission under the 1921 Brooks-Coleman law, which places that question in the jurisdiction of the commission. He said that so far as Minneapolis is concerned its larger earnings have been covered, so as not to show a disparity with the earnings of the St. Paul City Railway.

Mr. Wilcox is quoted in part as follows:

> The company's case was stronger last August than it ever will be again. At that time it was anxious to prove the value of its property by the appraisals previously made on behalf of the city. Since then prices have been coming down and its operating expenses have decreased. It has been forced to abandon the fifty-fifty rule of division on the intercity lines.
>
> I estimate that a proper adjustment of its accounts for 1921 would show an income derived from operations within the city of Minneapolis sufficient to pay 6 per cent on $29,000,000, or nearly 12 per cent on $15,000,000. I estimate that with the reduction of expense in effect since the first of the year, the company's true operating income for 1922 in Minneapolis at the present rate of fare will be sufficient to pay 6 per cent on $40,000,000, or 16 per cent on $15,000,000.

Mr. Wilcox is of the opinion that if the Minneapolis Street Railway could be freed of its twin city intercorporate relations its credit, based on its own earning power, would be as high as that of any electric railway in the country. Further, that under the present rate of fare the company without difficulty could finance its improvements out of earnings, as it has done in the last five or six years, despite the fact of its relations with the other companies which are at present included in the twin city system.

Transportation News Notes

Traffic Survey for New Orleans.—Paul H. Maloney, Commissioner of Public Works in New Orleans, has just arranged with John A. Beeler of New York to make a comprehensive traffic survey of the electric railway lines in New Orleans.

Increased Service in Effect.—The Interborough Rapid Transit Company, New York, N. Y., following out the order of the Transit Commission increased its service on May 31 by the addition of 263 trains. The details of the commission's ruling were given in the ELECTRIC RAILWAY JOURNAL, issue of May 6, 1922.

Agree on Single Fare.—The New York Transit Commission recently announced through its chairman that an agreement had been reached between the Interborough Rapid Transit Company and the Brooklyn Rapid Transit Company under which there will be dual operation with a single fare in Queens. From Queensborough Plaza in Long Island City to Corona free transfers will be issued.

One-Man Cars and Tokens in Use.—One-man cars and the token system for cash payments had their beginning in Erie, Pa., recently by the Buffalo & Lake Erie Traction Company. Seventeen one-man cars were operated with success, according to General Manager Meyers, who believes that this type of car will be instrumental in speeding up service. The tokens used have a value of 8 cents.

Approves of Jitney Ordinance.—The Circuit Court of Appeals has held valid the city ordinance regulating jitney buses in Green Bay, Wis. The ordinance rules jitneys off the streets used by traction lines and establishes a license fee of $100 a year, which the court has held reasonable. The court also pointed out the obligation of the city to protect the traction company against the unfair competition of jitneys.

New Schedules and Fares Announced.—The Northwestern Ohio Railway & Power Company, operating between Toledo and Bay Point, Marblehead, expected to issue new ticket books, on June 1, which would mean a 20 per cent reduction to the users of the tickets. They will be transferable and good for one year. The books will be put up in lots of 200 5-cent fares and will sell for $8. F. K. Woodring also reports that his company will run Sunday excursions from Port Clinton to Detroit for $2.50 during the summer. The week-end excursions to Buffalo will be continued this summer, connecting with the Lake Shore Electric at Sandusky and the Buffalo boat at Cleveland, starting June 11.

Personal Mention

These Men Run Municipal Railway

Brief Biographies Presented of Principal Department Heads of the Municipal Railway at Detroit Who Report to General Manager Goodwin —Organization Changes Noted Previously

INSTANCES are by no means rare in electric railway work of exceedingly young men being advanced to posts of great responsibility. In the select circle of such men there have been in the past, among others, Edwin C. Faber, who at twenty-six was general superintendent of the Cleveland Railway; Oren Root, Jr., who at twenty-nine was general manager of the old Metropolitan Street Railway, and Daniel L. Fennell, now superintendent of transportation of the Kansas City Railways, to mention just a few.

MR. RIDER IN CHARGE OF TRANSPORTATION

Now comes E. S. Rider to join the railway hall of fame. He has just been made superintendent of transportation of the lines in Detroit operated by the city. Mr. Rider was born only twenty-five years ago, on Feb. 9, 1897, in Norwalk, Conn. His first railway work was with the Connecticut Company as a clerk in the cashier's office in Norwalk. In December, 1914, he was made cashier in Norwalk, and in July, 1915, his duties as cashier were extended to include the Stamford division as well. During this employment he assisted in the operating department in making various reports and in December, 1917, was transferred to the accounting department in the office of I. A. May, general auditor, in New Haven. He continued in this position until July 11, 1917, when he was made traveling auditor to cover the various local properties comprised in the Connecticut Company's system.

From July, 1917, until August, 1919, Mr. Rider served in the United States Navy, and then returned to the Connecticut Company under Mr. May, continuing in the auditing work until November, 1919. From then until October, 1920, he acted as chief clerk of the Bridgeport division. After Joseph S. Goodwin had become established as the manager of the Municipal System in Detroit, Mr. Rider was taken on by him as timekeeper in connection with the extensive construction work then in progress. After this was completed he was transferred to the accounting department, then to the maintenance of way department.

A CONSPICUOUS SUCCESS

When the first twenty-five cars were placed in operation on the municipal railway in Detroit, Mr. Goodwin had no superintendent of transportation to take charge, and as he was extremely busy with other things and could not give the matter his personal attention, he turned the direct work over to Mr. Rider and intended himself to follow it rather closely. Mr. Rider, according to Mr. Goodwin, made such a conspicuous success of this work as the property grew from twenty-five cars to 300 cars, and then to 428 cars, that he seemed to be the logical man to trust with the responsibility of acting as superintendent of transportation for the present system comprising 1,457 cars. Mr. Rider now has under his jurisduction a system comprising seven divisions and 3,500 trainmen, and he is probably the youngest superintendent of transportation in the industry.

A. C. Colby, superintendent of equipment, Department of Street Railways, Detroit, has been connected in a similar capacity with the Municipal system almost from the first. In his early work he was responsible for all of the details in connection with the specification and purchase of 250 safety cars and 50 Peter Witt type double-truck cars, which comprised the municipal system up to the time that the first purchase of 30 miles of the Detroit United Railway system was made. He now has entire responsibility for all of the mechanical equipment of the Detroit system.

MR. COLBY HAS HAD WIDE EXPERIENCE

Mr. Colby was born in Vermont, in 1878, and started his railway experience as a conductor of the Rhode Island Company in 1900. In 1905 he started work in the mechanical department doing pit work and general repairing at one of the carhouses, and gradually worked up through the mechanical department to more important positions. In 1909 he went to South Bend, Ind., as general foreman in the shops of the Chicago, South Bend & Northern Indiana Railway under F. M. Weld, master mechanic, who is now master mechanic for Mr. Colby in Detroit. He remained there one year and then went to Birmingham, Ala., where he was engaged entirely on the rebuilding of the rolling stock of the Birmingham Railway, Light & Power Company.

When the Birmingham, Ensley & Bessemer Railway was opened, Mr. Colby became the first master mechanic. A year later he accepted a position with the Berkshire Street Railway, Pittsfield, Mass., one of the subsidiaries of the Connecticut Company, and continued in this position for four years. In 1917 he was transferred to Bridgeport as master mechanic of the Bridgeport division, and then on Feb. 1, 1920, was transferred to New Haven, Conn., as mechanical engineer in charge of the maintenance of equipment on the New Haven division. In September, 1920, he left the Connecticut Company to become superintendent of equipment of the Municipal system in Detroit.

H. M. Gould, electrical engineer of the Department of Street Railways, Detroit, Mich., became connected with the Municipal Railway in August, 1920, as electrical engineer. He was formerly superintendent of overhead lines for the Connecticut Company, New Haven, Conn. Mr. Gould was graduated in 1907 from the Sheffield Scientific School, electrical engineering course. He spent the two years following his graduation in the electrical department of the Long Island Railroad. The next year he spent as a student engineer with the Metropolitan Street Railway, New York City. He then engaged for some time in miscellaneous electrical work and in January, 1912, entered the city engineer's department in Bridgeport, Conn. He left this position later that year to go with the Connecticut Company.

W. D. Edgecomb, engineer of maintenance of way of the Department of Street Railways, city of Detroit, was the first man employed by the Street Railway Commission after the election at which the municipal street railway bond issue carried. His work began on April 7, 1920, five days after the election. At the age of seventeen Mr. Edgecomb felt a desire to become an engineer and from that time he has been connected with general engineering field work, supplementing his work with hard study. He was born in St. Paul, Minn., and moved with his parents to Michigan when he was seven years old. About fifteen years of his experience was gained with the Grand Trunk and the Grand Trunk Pacific railways on heavy mountain constructions and on maintenance of way as assistant engineer. He was office engineer for a short time for the railway in Montreal, but always preferred field work.

As assistant engineer in charge of maintenance of way with headquarters in Detroit, he was in charge of and thoroughly familiar with all station surveys and grade work in his division. His first work for the city of Detroit was as instrument man in 1891. Later he returned to the railroad work, with which he was connected until 1914 with the exception of the year 1912, when he was in California for his health. From 1914 to the time he took up work with the municipal street railway he was assistant engineer in the city engineering department in charge of field work connected with Detroit's sewer program and also on grade separation work of the city.

The complete line-up of the officials of the Department of Street Railways, Detroit, of which J. S. Goodwin is general manager, was published in the ELECTRIC RAILWAY JOURNAL for May 20, page 839

Fifty Years Spent in Street Railroading

All New England Pays Tribute at Manchester, N. H., to Remarkable Record of E. C. Foster—Gala Occasion for Members of Railway Club —Employees Also Participate in Celebration

"Golden opinions from all sorts of people."

SUCH were expressed on May 25 to E. C. Foster, president of the Manchester Traction, Light & Power Company. The occasion was the regular monthly meeting of the New England Street Railway Club, called at Manchester, N. H., primarily to observe the fiftieth anniversary of Mr. Foster in the street railway industry. It was a gala occasion for the club, but not a whit less so for the employees of the company of which Mr. Foster is the head. No matter how deeply he had endeared himself to his fellow railway men of New England, Mr. Foster was after all the chief of the men and women of the local system and they staged a little celebration of their own. From them and the officers connected with the company there were presented to Mr. Foster a smoking set, flowers and an engraved cigarette case. From the members of the club Mr. Foster received an eight-day chime clock.

Mr. Foster Devoted to His Duties

Henry C. Attwill, chairman of the Public Utilities Commission of Massachusetts, in the speech which he made at the meeting of the railway men, attributed Mr. Foster's accomplishments in life to his disinterested and unselfish devotion to duty in every task he was called upon to perform. He inspired confidence in public authorities, in the general public, in those whose money was intrusted to his care and in the employees with whom he dealt. It was Mr. Attwill's thought that Mr. Foster could have no better reward than he was receiving at the hands of the assembled railway men and in the knowledge that the people at large appreciated his many good qualities.

Mr. Attwill's was, perhaps, the principal encomium to the man who had just completed fifty years of service in the industry. Among others who paid tribute to Mr. Foster were Patrick F. Sullivan, Henry C. Page and Edward A. Dana. Mr. Sullivan has known Mr. Foster intimately longer than any other railway man. He disliked to praise a man to his face, but had felt no misgivings in doing so in the case of Mr. Foster. Mr. Dana expressed particularly the appreciation of the younger men in the railway field, many of whom Mr. Foster had encouraged and assisted by his helpful advice.

Mr. Foster's Career Outlined

Of such was the bulk of the praise made up. Few there are who remain in the industry today that have the background to draw upon possessed by Mr. Foster. At seventy he is carrying responsibility that many younger men would be loath to assume. The railway business makes peculiar demands upon a man, but Mr. Foster has never shirked any of them. Just fifty years ago to the day of the meeting of the club Mr. Foster entered street railway work with the Lynn & Boston Railroad. This was May 25, 1872. Mr. Foster gradually worked up through the several departments until April 1, 1883, when he was appointed acting superintendent. In November of the same year he was made superintendent, and in 1892 general manager. The Lynn & Boston was later taken over by the Massachusetts Electric Companies and Mr. Foster became

E. C. Foster

vice-president and general manager of that company. Mr. Foster next went to New Orleans. This was in May, 1903. He was at first president of the New Orleans Railways, but when the New Orleans Railway & Light Company was organized Mr. Foster was made president of the company and continued with that company until 1909. He then became associated with Sanderson & Porter in valuation work, and in December, 1911, was made president of the company at Manchester. Mr. Foster was born at Hancock, N. H., on Oct. 23, 1852.

There is the bare outline. It is a record such as one expects to find in "Who's Who" and the kind that one is not disappointed in finding there. It answers its purpose as a recital of dates but of events it tells precious little. From it, for instance, who would ever guess that Mr. Foster has a record of never having had any serious troubles with labor on the roads he has managed. In short, the life of the man has simply been replete with facts and incidents worth relating. Those that have occurred in recent years have had to do mostly with details of operation. To them does not of course attach the romance that went with pioneering of the early days. In these Mr. Foster had a very big part and they are today among the most charming of his recollections.

For instance, there is the recollection of the thrill that went with the letting of the contract for the electrification of the Lynn & Boston Railroad. That could be experienced but once. On July 4, 1888, the first section of road was opened at Crescent Beach, Mass., with a few cars. In those days the men on the horse car lines being converted to electricity were wont to believe anything the new tribe of electrical engineers told them. They soon got over this, however. Thus, Mr. Foster has related how he willingly paid $7 for a trolley wheel which later was made in quantities to sell for less than a dollar. Such was the extent of the faith of the early managers in the superior knowledge of the new school. It was a big event, this electrification, for the Crescent Beach division of the Lynn & Boston Railroad was the first electric railway built by the Thomas-Houston Electric Company, as well as the first passenger trolley line in Massachusetts.

This is just one of the happenings taken from the busy life of Mr. Foster. It serves, however, to tie him in with a myriad of other events that those in the industry in the early days will readily recall. Never again will the opportunity be afforded in the electric railway business for a repetition of just such incidents as the one recited. It was William Knox who in verse propounded the question:

"O! why should the spirit of mortal be proud?"

To this seemingly unanswerable question Mr. Foster and others like him have returned the answer in the record of their achievements. For in the long run these men have done many times more for others than they have ever done for themselves.

J. W. Shartel a Commerce Director

John W. Shartel, vice-president and general manager of the Oklahoma Railway, Oklahoma City, was elected a director of the Chamber of Commerce of the United States at the meeting held by that organization in Washington, D. C., last week. Mr. Shartel will represent the fifth district of the country in the board of directors. Mr. Shartel attended a meeting in Washington, D. C., late in May, where he made an address at the first session of the Chamber's section on Transportation and Communication. His subject was the labor situation. Mr. Shartel is an enthusiast on electric traction, and has many plans for the extension and improvement of the electric railway system centering in Oklahoma City. He is a strong advocate of the high speed entrances for interurban cars into the centers of cities without grade crossings at either highway or railway. His election to the board of directors of the Chamber of Commerce is gratifying to the electric railway industry.

D. U. R. Personnel Reorganized

Rearrangement of Departments and Officials Followed the Sale of the Traction Lines in Detroit to the City—600 Miles of Line Are Still Under Operation by the Company

BEFORE formally turning over the property of the Detroit United Railway in Detroit to the municipality E. J. Burdick, vice-president and general manager, issued a bulletin announcing the force that would remain with the company to operate the interurban lines and the city properties in Port Huron, Flint, Pontiac, Mt. Clemens and Ann Arbor. In prefacing this list of names Mr. Burdick said:

> The reorganization of existing forces occasioned by the change is indicated in the following list of personnel of the various departments. The one regret of the management is that it cannot take over all of the present organization and it takes this occasion to express its sincere appreciation of the splendid efforts of each and every employee in the past and of its willingness and desire to assist them to employment with the city lines or elsewhere.

Only about 200 men and women were left unemployed by either the company or the city.

The general office force, as appointed by Mr. Burdick, consists of twenty-three people. Chief among these are the following:

Auditor.....R. G. Skeman
Acting cashier.....Roy Hoover
Assistant purchaser.....F. L. Wheaton
Supervisor of schedules.....J. H. Brooke
General timekeeper .....W. M. Spaulding
General superintendent .....Harry Bullen
Assistant general superintendent.....
.....P. L. Radcliffe
Publicity manager ....A. D. B. Van Zandt
Real estate commissioner.....Thos. Beath
Inspection service.....F. A. Galloway

The resignations of J. F. Keys, general passenger agent, and of G. W. Wagner, purchasing agent, have been accepted to take place in a short time. No successors will be appointed, the duties of Mr. Keys falling under the traffic department and those of Mr. Wagner will have the direct supervision of General Manager Burdick, with the details cared for by the assistant purchaser.

A similar number constitutes the traffic department, chief among whom are:

General traffic manager.....W. S. Rodger
General freight and express agent....
.....Nathan Rumney
Traveling freight agent..R. W. Thompson
Auditor freight accounts.....J. B. Hooper

Because all accident cases accrued up to the time of the transfer of the city lines remain to be disposed of by the D. U. R. a large proportion of the old claims organization has been continued. This numbers thirty in all, chief of whom are:

General claims attorney..W. G. Fitzpatrick
Assistant to claims attorney..B. J. LeBoeuf
Chief trial division.....G. M. O'Connor
Chief investigator .....L. E. Schimmel

Numerically the majority of the force attached to the accounting passenger receipts department was transferred to the city payroll. The remaining force consists of thirty-seven under charge of:

Auditor passenger receipts....J. W. Slater
Assistant auditor .....Bert Thompson

Mr. Slater was assistant in this department and was promoted with the resignation of W. B. Brooks, brother of F. W. Brooks, formerly president of the company. Mr. Thompson was attached to the cashier's department before the reorganization.

Inasmuch as the company's properties now consist largely of high-speed lines it was thought advisable by Mr. Burdick to organize an engineering department more in line with the practice of steam road operation. With this in mind the track department of the old organization has been worked into the engineering department, with enlarged powers covering the engineering problems of other departments as well. The department will have charge of all engineering work except the operation of the power houses and substations. Thus its use will be made available for all departments including the operating department. In the engineering department are:

Chief engineer .....J. M. Mudie
General roadmaster .....L. N. Hayden
Engineer .....C. A. Handy
Engineer .....H. B. Woodward
Engineer .....H. Carter
Bridge engineer .....F. A. Shaft

The creation of the engineering department gives a marked promotion to Mr. Mudie. Mr. Handy, now attached to this department, was, in the old organization, consulting engineer in charge of appraisal work. John Kerwin, formerly superintendent of tracks, retires from active railway life.

The electrical department has also undergone some radical changes and is now divided. W. J. Vaughn has been made superintendent of distribution and as such is in charge of overhead and underground work, the signal system and also the telephones. Powerhouses and substations come under the direction of the power department, with H. F. Rech as assistant superintendent of power, acting directly under the general manager.

Another department that has been very considerably altered is the mechanical department with a superintendent of shops in charge. In this department are:

Superintendent of shops.....Hugh Savage
Accountant .....R. S. Wilson
Chief storekeeper.....David Thibault

As storekeeper Mr. Thibault will have direct charge of the stores of all departments including those of the general offices. Sylvester Potter, formerly head of the shops as master mechanic, remains with the company doing special work under the direction of the general manager.

The powers of the superintendents of the several interurban lines have been enlarged. These officials now have supervision of all buildings and their employees, as well as the operating force, with the exception of powerhouses and substations and the employees thereof. Motormen and conductors will be hired directly by the superintendents, the position of superintendent of employment being abolished.

A. E. Peters as secretary and Joseph Bampton as assistant treasurer continue with the company and are direct appointees of the board of directors.

As a part of the change the several departments of the Detroit United have been consolidated under one roof at Highland Park. There the company retained fifteen acres of the extensive and valuable Highland Park shop properties, one unit of which is being converted to the use of the company for its general offices.

Obituary

Arthur B. Stitzer

Arthur B. Stitzer, vice-president and chief engineer of the Republic Engineers, Inc., died from hemorrhage of the stomach on May 26 while on a business trip. He was taken ill on a train of the Pennsylvania Railroad and was removed to the Altoona Hospital, but passed away within a few hours. Mr. Stitzer was born July 20, 1877, and his early life was spent in Philadelphia. He was graduated from the University of Pennsylvania in 1899 and ten years later received the degree of electrical engineer from that university. After leaving college he became connected with the Union Traction Company of Philadelphia and later with its successor, the Philadelphia Rapid Transit Company, with which he remained until April 25, 1910. He then resigned to become electrical engineer for Ford, Bacon & Davis, with whom he remained until April 30, 1917, when he was appointed chief engineer of the Republic Engineers, Inc., of New York. On Feb. 10, 1919, he was elected a director of that company.

Mr. Stitzer has always taken an active part in the work of the American Electric Railway Engineering Association and the National Electric Light Association, and for the former was chairman of the power generation committee in 1921 and third vice-president of the Engineering Association in 1922. He was a member of the A.S.M.E., A.I.E.E., Franklin Institute and Railroad Club of New York. He was also prominent in Masonic circles. He lived in Orange, N. J., and leaves a widow and one son.

Orlando B. Ayers, right-of-way agent of the Puget Sound Power & Light Company, Seattle, Wash., died recently in Seattle. Mr. Ayres served the company as superintendent of collection and later as adjuster in the claim department. For some time he was associated in private business, and in 1921 returned to the company as right-of-way agent for the construction of the proposed intermountain power lines.

Car Manufacturer Speaks on Prices

W. H. Heulings, Jr., of the J. G. Brill Company, Emphasizes that Downward Trend Has Stopped—Change Attributed to Upward Turn in Steel Prices and Activity in Steam Car Building

One of the best informed men on the subject of cars and car prices in this country is W. H. Heulings, Jr., vice-president and general manager of the J. G. Brill Company, Philadelphia. Mr. Heulings was asked this week by a representative of the ELECTRIC RAILWAY JOURNAL to express his views for the Manufacturers and Markets Department on the subject of car prices and whether any changes might be expected in the early future. He consented to do so and his statement not only points out the conditions which tend to produce higher prices but declares that his company in June will be obliged to withdraw every quotation it has made on standard cars and figure the base price at about $6,000 or more for the single truck car and about $10,000 or more for the double-truck car. Mr. Heulings' statement follows:

"In October, 1920, the combined cost of labor and material entering into the construction of the Birney safety car reached its peak. Then commenced a decline in the steel market which started a corresponding decline in the price of safety cars. Gradually but continuously the selling price of the Birney safety car dropped from $6,800 a year or so ago, until it struck its present level of $5,800. It was the desire of the manufacturers to bring the price of rolling stock down to the point which would prove of sufficient interest to railway companies to encourage purchasing. Therefore, with every successive drop in the cost of material and labor, the very life was practically cut out of the price of the car, the manufacturers welcoming every opportunity to lower prices to the advantage of the purchasing companies. But now the raw material markets have stopped in their rush downward, and consequently the price of safety cars cannot be expected to go lower.

"As long as the price of steel and other materials entering into the construction of safety cars continued to drop so did the price, but the steel market has now stiffened and has every tendency to go higher. Steel bars quoted at 2.35 in January, 1921, dropped gradually until the low point of 1.40 was reached in February, 1922, and in March went higher to 1.50. Steel plates at 2.65 in January, 1921, also dropped to 1.40 in February, 1922, and increased to 1.50 in April. This upward turn in the steel market will also have the tendency to increase the selling price of safety cars just the same as the declining steel market had the tendency to lower prices. So much of the safety car and its equipment is constructed or evolved from pig iron or steel, the stiffening of the markets for these materials must be expected to have an important influence on safety car prices. Also there has been an increase within the past few months in the cost of yellow pine flooring, and in the case of many other materials entering into the construction of safety cars the long decline which was experienced has also been arrested.

"Then there is the increased activity in steam car construction. Purchases deferred for years are now being made and, consequently, there is a demand for skilled labor, such as is essential to the car-building trade, the like of which has not existed for quite some time. While electric railway car buying has picked up somewhat since Jan. 1, there is much room for improvement, and those who have been waiting for prices to reach their lowest level can now confidently enter the market with the feeling that by so doing they are buying to their own advantage. There is no mistaking the signs of the times. Prices are not going to go lower as long as the steel and other material markets continue their present direction. Quite a few far-seeing railway executives have recognized this fact within the past few months and have placed orders for much needed equipment.

"You will find some of our railway friends who will be inclined to believe the present condition of the steel and labor markets only temporary. They may decide to hold off longer in placing their orders for safety or other type cars. I have given you my views on the situation, and I think you will find that I am not far wrong when I say that the present market conditions will make it necessary for us in June to withdraw every quotation we have made on standard cars and figure the base price at about $6,000 or more for the single-truck car and about $10,000 or more for the double-truck car."

Advertising Conference in Milwaukee

THE first annual industrial advertising conference will be held in Milwaukee June 11 to 15 in connection with the eighteenth annual conference of the Associated Advertising Clubs of the World. Industrial advertising is defined as that which concerns the marketing of goods to industry as contrasted with the marketing of goods from industry to the individual consumer.

There will be one session on the afternoon of June 12 and two sessions on June 13. The speakers include J. C.

ELECTRIC RAILWAY MATERIAL PRICES—MAY 30, 1922

Metals—New York

Copper, electrolytic, cents per lb	13.875
Lead, cents per lb	5.70
Nickel, cents per lb	36.00
Zinc, cents per lb	5.725
Tin, Straits, cents per lb	31.75
Aluminum, 98 to 99 per cent, cents per lb	19.00
Babbitt metal, warehouse, cents per lb.:	
Fair grade	35.00
Commercial	15.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$6.125
Somerset mine run, Boston	3.375
Pittsburgh mine run, Pittsburgh	....
Franklin, Ill., screenings, Chicago	....
Central, Ill., screenings, Chicago	
Kansas Screenings, Kansas City	2.725

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$40.00
Standard open hearth rails, gross ton	$40.00
Railroad spikes, drive, Pittsburgh base, cents per lb	2.25
Tie plates (flat type), cents per lb	1.85
Angle bars, cents per lb	2.40
Rail bolts and nuts, Pittsburgh base, cents, lb.	3.625
Steel bars, cents per lb	2.10
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	1.35

Hardware—Pittsburgh

Wire nails, cents per lb	2.65
Sheet iron, (24 gage), cents per lb	3.05
Sheet iron, galvanized, (24 gage), cents per lb	3.70
Galvanized barbed wire, cents per lb	4.10
Galvanized wire, ordinary, cents per lb	3.00

Waste—New York

Waste, wool, cents per lb	13.00
Waste, cotton, (100 lb. bale), cents per lb.:	
White	10.00
Colored	9.00

Paints, Putty and Glass—New York

Linseed oil, (5 bbl. lots), cents per gal	92.50
White lead, (100 lb. keg), cents per lb	12.25
Turpentine, (bbl. lots), cents per gal	92.50
Car window glass, (single strength), first three brackets, A quality, discount*	85.5%
Car window glass, (single strength), first three brackets, B quality, discount*	86.2%
Car window glass, (double strength, all sizes, A quality), discount*	86.0%
Putty, 5 lb. tins, cents per lb	5.50

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb	15.50
Rubber-covered wire, cents per lb	5.75
Weatherproof wire base, cents per lb	15.50

Paving Materials

Paving stone, granite, 4 x 8 x 4, f.o.b. Chicago, dressed, per sq.yd	$3.20
Common, per sq.yd	3.00
Wood block paving 3½, 16 treatment, N. Y., per sq.yd	2.17
Paving brick, 3½ x 8½ x 4, N. Y. per 1,000 in carload lots	49.50
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.75
Cement, Chicago consumers net prices, without bags	1.97
Gravel, ¾-in., cu.yd., N. Y	1.75
Sand, cu.yd., N. Y	1.00

Old Metals—New York

Heavy copper, cents per lb	10.00
Light copper, cents per lb	9.312
Heavy brass, cents per lb	5.75
Zinc, old scrap, cents per lb	2.937
Yellow brass, cents per lb (heavy)	6.50
Lead, heavy, cents per lb	4.725
Steel car axles, Chicago, net ton	$15.75
Old car wheels, Chicago, gross ton	18.75
Rails (short), Chicago, gross ton	16.25
Rails (relaying), Chicago, gross ton	16.00
Machine turnings, Chicago, gross ton	6.50

McQuiston, Westinghouse Electric & Manufacturing Company; F. M. Feiker, McGraw-Hill Company; Max W. Babb, Allis-Chalmers Manufacturing Company; W. Lee, Frank D. Chase, Inc., and Edwin F. Gay, of the New York *Evening Post*. There will be an exhibit in connection with the conference.

$84,400 for Betterments

A bill recently introduced in the City Council of Seattle, Wash., and referred to the city utilities and finance committees provides for an appropriation of $84,400 for betterments to the Seattle Municipal Railway system, including $17,000 for the reconstruction of thirty cars. In addition to the appropriation for reconstruction of cars, the bill provides for $1,900 for adjustment of tracks at Thirty-fifth Avenue west and Government Way, occasioned by paving in the Fort Lawton district.

Structural Sales Near Capacity

Orders for fabricated structural steel placed during April were almost equal to the capacity of fabricating firms, according to reports made to the Department of Commerce by firms comprising two-thirds of the fabricating capacity of the United States. Sales reported during April amounted to 115,247 tons by seventy-five firms having a capacity of 116,918 tons, or at the rate of 99 per cent of capacity.

At this rate, the total sales throughout the United States, based on a total capacity of 180,000 tons, were 177,600 tons in April. This compares with 139,300 tons reported for March by the Bridge Builders' and Structural Society, based on reports of sixty-four firms showing sales at 77 per cent of capacity.

Rolling Stock

Jackson (Miss.) Public Service Company has purchased six new cars with modern equipment.

York Railways Company, York, Pa., is making a study of lightweight interurban cars with a view to possible purchase.

Quebec Railway, Light, Heat & Power Company, Quebec, Canada, will start in right away under the new management overhauling and repainting its rolling stock.

Youngstown & Suburban Railway, Youngstown, Ohio, has purchased two lightweight one-man interurban cars from the Kuhlman Car Company. These are equipped with four 25-hp. motors and 26-in. wheels. The body will have an arch roof and will be constructed largely of plymetal as a trial of this material.

Dallas (Tex.) Railway needs at least twenty-five double-truck cars in addition to those now in service to care for the passengers hauled on its lines, according to J. W. Monk, inspector of car service under the Supervisor of Public Utilities. Mr. Monk is now engaged in a careful check of all lines in the city in order that he may check up and recommend definitely how many new cars should be purchased. The inspector is of the opinion, however, that fifty new cars are needed to displace old and obsolete cars now in service and that at least twenty-five additional cars should be placed in service.

Track and Roadway

Northern Indiana Railway, South Bend, Ind., has announced that its city lines will be extended this year by laying of several miles of track.

Toronto Transportation Commission, Toronto, Canada, will start work shortly on the construction of a double-track line from Sunnyside to the Humber.

Georgia Railway & Power Company, Atlanta, Ga., expects to buy 600 tons of 122-lb. A.E.R.A. girder rail with track accessories.

Georgia Railway & Power Company, Atlanta, Ga., has purchased 120 miles of No. 0000 seven-strand bare copper cable and 210 miles of No. 00 seven-strand bare copper cable for transmission lines.

Trenton & Mercer County Traction Company, Trenton, N. J., has completed the work of the grand union at State and Broad Streets, Trenton. The cost of this union to the company is $25,000. It will be of great convenience and a saver of time in the switching of cars.

New York, N. Y.—The Transit Commission has awarded the contract for the construction of the elevated extensions of the Fourteenth Street-Eastern District line from Meserole Street, Brooklyn, to East New York to the Joslin Construction Company.

Quebec Railway, Light & Power Company, Quebec, Canada, has announced through its president that a number of extensions of the system to points in the vicinity of Quebec will be completed in the course of the next few years.

Shops and Buildings

Los Angeles (Cal.) Railway has started work on the third automatic substation in a program for increased power facilities throughout the system. The station is located near Melrose Avenue and Kingsley Drive and will serve the northwest section of the city. A 1,000-kw. General Electric converter will be installed in an artistic building of Spanish architecture. The complete cost is estimated at slightly over $100,000. The Los Angeles Railway has two automatic substations already in operation. One is located in the company's Vernon store yards and serves the southeast district. The second is in the Garvanza region at Avenue 56 and York Boulevard, the north end of the city.

Trade Notes

Wagner Electric Manufacturing Company, St. Louis, Mo., announces the removal of its Salt Lake City office to 313 Doodly Building.

Track Specialties Company, New York, N. Y., has announced the appointment of Walter R. Pflasterer as agent for the Chicago territory. He will be located at 527 Manhattan Building, Chicago.

Laconia Car Company, Laconia, N. H., has had a steady manufacturing program on hand during the current year. In recent weeks as many as sixty cars have been turned out and the unfilled orders amount to $1,500,000. In the first three months of 1922, net earnings were reported amounting to $50,000. It is believed that the second quarter of the year will show an improvement over this figure.

Westinghouse Electric & Manufacturing Company reports contracts for power apparatus during the past week as aggregating more than $1,000,000. The companies from which the contracts were received are the Public Service Production Company, a subsidiary of the Public Service Company of New Jersey; the United Gas Improvement Contracting Company of Philadelphia, and the Luzerne County Gas & Electric Company of Pennsylvania.

New Advertising Literature

Uehling Instrument Company, Paterson, N. J. has issued Bulletin No. 113 on gas filters for CO_2 recorders.

Drew Electric & Manufacturing Company, Cleveland, Ohio, has just issued a leaflet describing its floating bell hanger used in connection with line construction.

Aeroil Burner Company, Inc., Union Hill, N. J., has just issued a new bulletin, No. 20, describing oil-burning appliances for paving, road building and various shop work.

Allis-Chambers Manufacturing Company, Milwaukee, Wis., has just issued a new bulletin, No. 1109, covering distribution transformers having ratings of 200 kva. and smaller, suitable for lighting and power purposes, and of the oil-immersed, self-cooled, outdoor type.

The Indianapolis Switch & Frog Company, Springfield, Ohio, has recently published a thirty-two page booklet dealing specifically with Indianapolis Apex and Simplex Welded Joints and electric welding in general as applied to track maintenance and construction.

Indiana Steel & Wire Company, Muncie, Ind., has issued a sixty-four page cloth-bound booklet on double galvanized steel strand and iron wire for electrical transmission and distribution lines. The booklet contains a technical report covering tests on wire.

Canadian Railway Men and Manufacturers Pull Together

THE Canadians held a rousing three-day convention at Quebec during the first week in June. The extreme easterly location of the city perhaps worked against a really large attendance, although the associate (supply) members gave practically 100 per cent support to the first exhibit held in connection with the Canadian Association conventions. While they incurred an expense which was possibly larger than was warranted by the actual attendance of railway men, nevertheless the feeling was general that the effort made this year will bring results next year and thereafter. If next year's meeting is held at Toronto, as was suggested, the central nature of the location will help toward making exhibits a regular feature.

The Canadian Association is in a peculiar position, due to the large number of municipal railways in its territory, which, in contrast with the rules of the American Association, are eligible to membership. This is a factor in connection with the attendance at meetings. Particularly in the smaller cities, the City Council looks askance at proposed expenditures of this kind by the municipal street railway manager. A successful exhibit like that just held ought to be an effective sales argument in such cases. And if the Councilmen could see how seriously the discussions are participated in and how distinctions among railway company officials, city representatives, commissioners and manufacturers are obliterated at the meetings, with consequent benefit to all concerned, they would promptly O.K. all reasonable requests for convention expense authorizations.

Action Needed on Highway Taxation Problem

AT PRACTICALLY every convention of electric railway men in the last year the subject of taxation of buses and trucks which use the highways as common carriers has been discussed at length. Nearly every one, not only railway men who have a peculiar interest in the matter, but men from nearly all walks of life, agree that it is unfair to the general taxpayers to permit this destructive use of the roads without adequate compensation therefor. The automotive interests themselves have long realized that it is only a matter of time until they will have to assume a share in the cost of road maintenance and possibly construction. But being quite human, they naturally have not been going about advocating greater taxation and urging public bodies to hasten to add a substantial burden to their operating costs.

Perhaps it takes a lot of discussion and a long time to crystallize public sentiment sufficiently to enable the passage of legislation. However, it would seem to be about time for the railway men to transform discussion of the problem into definite steps to bring it before the state legislatures and then work to secure passage of just bills. Because of their double interest, first as large taxpayers and, second, to avoid helping to pay the maintenance-of-way costs for their competitors, the railways particularly are justified in taking the initiative in bringing this important matter to a head. As broad as this problem is, to date only two states—Illinois and Maryland—have attempted by legislation to correct the obviously unfair situation.

How Much Tax and How Shall It Be Applied

HOW to apply the tax and how much the charge should be are problems the solution of which will require very careful study and the accumulation of data not now available. In general, however, railway men should bear in mind that they have reason to think well before attempting to create too great a penalty for the highway users. They may later want to go into the bus or truck transportation business themselves; in fact, they are quite likely to do so. Some have advocated that steps be taken to get the railways relieved of some of their burdens rather than to spend energy in getting the other fellow loaded down with taxes and restrictions. This is certainly a commendable thought, but there is no use wasting time and effort on a proposition that is foredoomed to failure.

There is little possibility of directly freeing any one from any levy now. The tendency and study is to find new sources of revenue. But any portion of the cost of maintenance and construction of roads that is put definitely on the users relieves the railways proportionately and places their competitors on a more fairly comparable basis of operating expense. Both railways and highway transportation companies must continue to be taxed on their physical property value. In addition, the buses and trucks should be taxed a sum that will fairly represent the cost of the road depreciation which they cause. Whether this shall be distributed on a ton-mile and seat-mile basis, on a gasoline tax basis, or how, is open to debate and further study. In Maryland trucks of common carriers are charged $\frac{1}{3}$ cent per ton-mile for gross weights up to 6,000 lb., $\frac{2}{3}$ cent from 6,000 to 12,000 lb. and $\frac{3}{3}$ cent for weights over 12,000 lb. Buses are taxed $\frac{1}{20}$ cent per seat-mile for vehicles of less than 3,000 lb. net weight, $\frac{1}{15}$ cent for weights from 3,000 to 7,000 lb. in interurban operation or up to 8,500 lb. if equipped with pneumatic tires, or up to 8,500 lb. for solid tires when the haul is entirely within an incorporated community. Over these limits of 7,000 and 8,500 lb. the rate is $\frac{1}{8}$ cent per seat-mile. In Illinois buses must pay $\frac{1}{20}$ cent per seat-mile and trucks $\frac{1}{2}$ cent per vehicle-mile without regard to weight.

The most extended official consideration of this subject which has been made is undoubtedly that represented by the report of the Davenport committee appointed by the New York State Legislature to study the

Digitized by Google

question of taxation in that State. This committee had previously made a report on electric railway taxation in New York, and it had found that the railway companies were greatly overtaxed as compared with other lines of business, particularly other utilities. Its study of the existing practice of motor vehicle taxation resulted in the opposite conclusion, and in its report dated March 17 it recommended an increased State tax, based on the weight of car and type of tires, with double rates for public passenger vehicles and a tax of 1 cent per gallon on gasoline sold in the State.

Railways' Better Financial Condition Is Understood by Bankers

FURTHER testimony of the improved financial conditions of the electric railways is given in an interim report of the committee on public service securities of the Investment Bankers' Association of America. This report not only declares that the appreciation in the market values generally of both senior and junior securities of utility companies is marked, but it calls particular attention to what it calls "the fundamental soundness of the electric railway business," which "is as essential as light and power services and in the interests of the public welfare must be assured as sound a financial basis as they."

This is refreshing reading and reflects a state of mind quite different from that which existed only two years or so ago when it was not an uncommon thing for investment bankers, when advertising the securities of utility companies, to point out that the utility derived little or none of its income from railway property. The ELECTRIC RAILWAY JOURNAL at the time referred to this practice editorially as unfortunate, and it is censured also in the Investment Bankers' interim report. Fortunately, at the present time, the practice is decreasing, if it has not entirely disappeared.

One of the most interesting statements in the interim report is that suggesting the desirability and possibility now of financing extensions to utility enterprises by the sale of junior securities, especially to customers of the operating companies, together with the suggestion that the investment bankers themselves might well devote more attention to the development of markets for these securities. Up to this time most of these security sales to customers have been made directly by the utility. Now that this means of financing has been quite well established and is known to have some very pertinent advantages to the utility, it is quite natural that the bankers should be giving it consideration to avoid the loss of good sources of salable issues. There are undoubtedly some advantages, however, in employing an investment banker as an intermediary, and these advantages probably outweigh the disadvantages, provided the utility retains a general supervision of the plan of campaign.

The principal gain in turning this matter over to an investment house is of course the fact that the sale of securities, like any other kind of work, can usually be done more effectively and economically by experts than by those who must conduct the work as a side issue. Any campaign of this kind in one city is very similar to that in another, and experience in several communities ought to show the best way of undertaking the work, as well as what to avoid. This is the experience the investment banker has to offer, in addition to experienced salesmen backed by the reputation of the house.

Radio May Have Place in Railway Field

MOST electric railway engineers, like every one else, are thinking of radio primarily as a means of light entertainment. That it may come to have a really significant value in the railway business, however, is an imminent possibility. In theory there are a number of applications that are entirely feasible. It remains for experiment and development to prove them practical. If radio can be successfully applied in the electric railway field, it will bring a very important improvement in the degree of continuity of service.

The ordinary wire telephone, useful as it is under normal conditions, often goes out of commission altogether during a heavy electrical or sleet or wind storm, just when it may be needed the most to direct operations during emergency conditions. Interruptions to power supply are also not infrequently accompanied by a consequent disruption of telephone service. At such times as these radio transmitting and receiving sets installed at power houses and switching centers might provide the means of communication that would prevent long delays to service. Load dispatching seems quite within the realm of radio communication as a supplement to the telephone system, both technically and financially, because the number of sets needed is comparatively small. Some progress has already been made in this direction, particularly by those power companies that have remote sources of energy, delaying prompt patrol of lines.

Dispatching trains by radio, supplementing the telephone, may be a possibility, at least to the extent of affording communication between fixed stations and the dispatcher. Placing receiving sets on the cars direct brings in difficult transmission problems and entails a high investment, but it is not an impossible thing. It is even within the realm of possibilities that a radio signal system may be devised doing away with the necessity for overhead signal wires. Or it may be found possible to operate by radio a signal indication in the motorman's cab whereby a dispatcher could retain constant communication with each train. In thinking of these seemingly fantastic possibilities it should be noted that once a radio relay is operated, it becomes possible to accomplish almost any local electrical operation. Such a relay has been designed and used successfully in experiments.

One of the simplest and most readily available uses of radio for the electric railway is for the purpose of keeping in touch with line construction and maintenance crews while out on the system. For example, instead of having an emergency line crew sitting idle for hours at a stretch in order that it may be reached promptly at the end of a telephone line, the line car or truck could be equipped with a radio receiving set and the crew thereby kept within call while out doing maintenance work.

A small amount of experimental work has already been done along some of these lines—enough to justify the belief that there is more than an entertainment interest in radio for electric railway engineers. But practically the whole development work is yet to be done. One of the restrictions upon a full development of the railway application is the involved patent situation which makes it difficult or impossible to get suitable apparatus. Other limitations are the requirements as to license for transmitting stations, the small range of wave lengths reserved for the use of utility companies and the interference from other radio sets and from static. Nevertheless the subject would seem to merit earnest study.

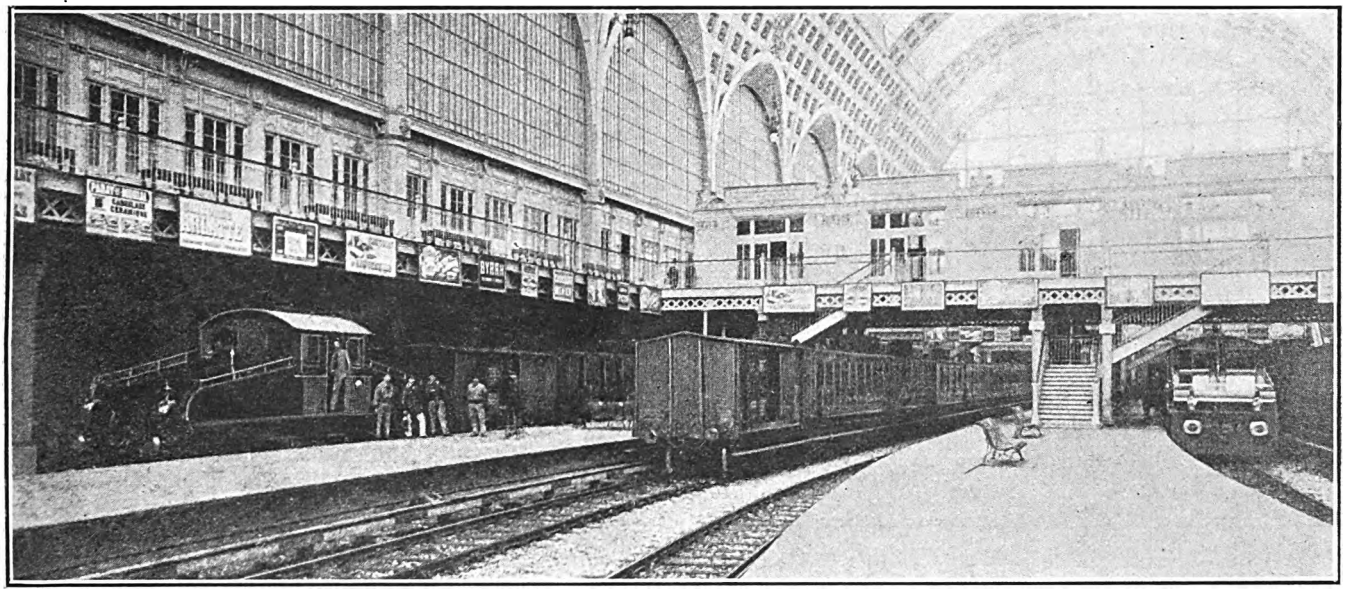
France Making Real Progress in Electrification

Paris-Orleans Railway, a Pioneer in Electrification, Will Electrify at Once a Complete Steam-Engine Division with Direct Current at 1,500 Volts—Other French Railroads Will Follow Suit —Total Mileage Involved in Twenty-Year Program Is 5,000

BY PAUL CHARPENTIER AND EARL M. BILL
Engineer Compagnie Française Thomson-Houston and
Railway Engineering Department General Electric Company Respectively



AN ELECTRIC TRAIN PULLING OUT OF QUAI D'ORSAY STATION IN PARIS

IN VIEW of the present-day trend toward the electrification of the railroads in the United States a short survey of the progress of the electrification of French railroads should prove of interest to the American railroad man. This is particularly true in the light of the recent announcement that $8,000,000 in contracts for the electrification of the Paris-Orleans Railway have been let to a group of French manufacturers headed by the Compagnie Française Thomson-Houston, representative of the International General Electric Company, and that American concerns will participate in supplying some of the equipment. This announcement was published in the ELECTRIC RAILWAY JOURNAL for May 27.

Before reaching its conclusions in regard to electrification the French government caused exhaustive investigations to be made of all important electric traction systems throughout the world; collected all possible available data; determined the probable savings in operation that could be expected; made a decision as to system to be used, and laid out a definite program for railway electrification on a national scale.

During the war years and those preceding it became obvious that steps must be taken to reduce the consumption of coal, much of which was imported. As the war progressed plans had to be made for the rehabilitation of railway equipment to care for the expected resumption of heavy traffic which had fallen off during the war.

To study ways and means to accomplish these things, there was appointed a committee of more than thirty engineers representing all departments of the several French railway systems as well as the various technical departments of the French government, including the telegraph and telephone departments.

This committee conducted extensive investigations in France, Italy, Switzerland, England, Sweden, Germany and the United States with a view to determining (1) what benefits could be obtained by the electrification of French railways, (2) what system of electric traction should be used and (3) means for standardizing the selected system for all French railways.

FINDINGS OF COMMISSION

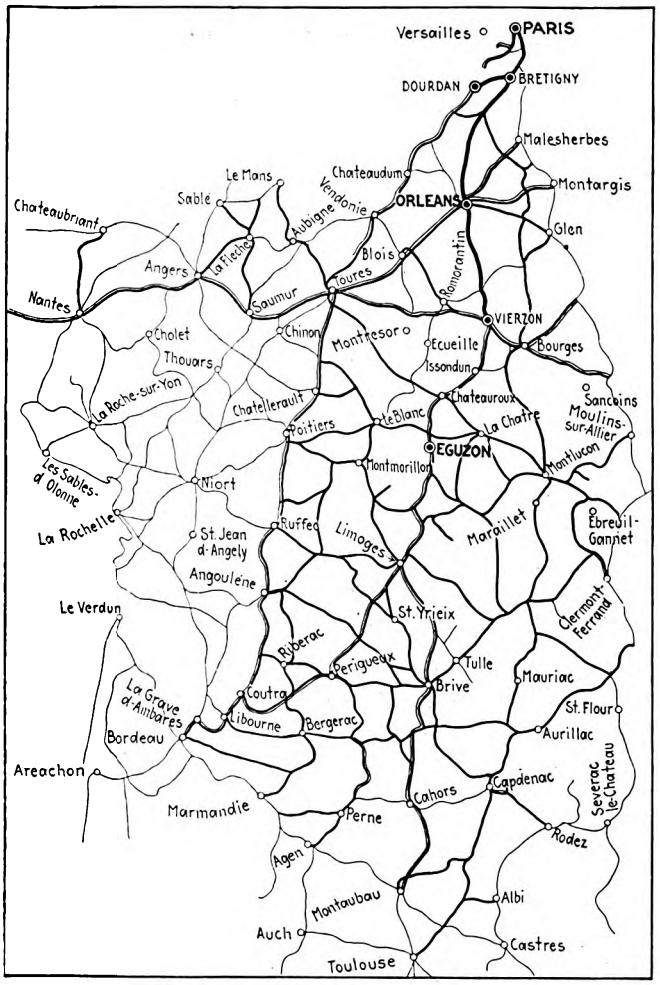
As a result of the investigations of this committee, it was recommended that:

1. Direct current, at 1,500 volts, be standard for all French railways.
2. A defined program of sections and lines be laid out for electrification.
3. Water power in the Pyrenees mountains be utilized by the Midi, in the Alps by the Paris-Lyons-Mediterranean and in the central mountain district by the Paris-Orleans Railways.
4. The railway power transmission lines be consolidated with those for industrial power and lighting.
5. A frequency of 50 cycles be used for all future alternating-current installations and that certain voltages be used as standards for the high-tension power transmission.

A glance at the layout of a French railway system, of which Paris-Orleans, as shown in the accompanying map, is typical, will show that it consists of a network of main and branch lines. The average distance between junction points is about 15½ miles, and it was considered that 1,500 volts d.c. would allow the installation of substations about every 15½ miles, or at each junction.

Serious consideration was given 2,400 volts d.c., but as it was thought that the lower voltage was more

Digitized by Google



MAP OF PARIS-ORLEANS RAILWAY SYSTEM, SHOWING NETWORK CHARACTER AND DIVISION NOW TO BE ELECTRIFIED

easily applied to motor cars and would also allow the use of a third rail, it was adopted.

The use of water power will occasion a great saving in coal, as the committee anticipated that 1,160,000,000 kw.-hr. per year would be used on the nearly 5,500 route-miles of the P.-O., the P.-L.-M. and the Midi Railroads, all obtained from water power, and that in twenty years the consumption would be about 2,260,000,000 kw.-hr. per year. On the basis of about 2 lb. of coal being required per kilowatt-hour in a modern steam station, the expected savings in coal would vary from, say, 1,160,000 to 2,260,000 short tons per year.

The selection of 50 cycles as the standard for the production of alternating current involves the giving up of the generation of 16⅔ and 25 cycles for either single or three-phase traction. Obviously the consolidation of railway power transmission lines with those for industrial and lighting service means fewer and better transmission lines.

ELECTRIFICATION BEGAN IN 1898

In 1898 the Paris-Orleans started the electrification of its underground terminal between Paris-Quai d'Orsay and Paris-Austerlitz stations, a distance of about 2.6 miles. This included a 600-volt, direct-current, third-rail distribution and eight 49.5-ton locomotives. Three-phase synchronous converters with transformers converted the 25-cycle, 5,500-volt, three-phase power transmitted from the Ivry steam station through underground cables.

In 1905 this electrification was extended from Paris-Austerlitz to Juvisy, a distance of about 12 miles. Three more locomotives and about ten motor cars were purchased. Two more substations were installed to take care of the extension.

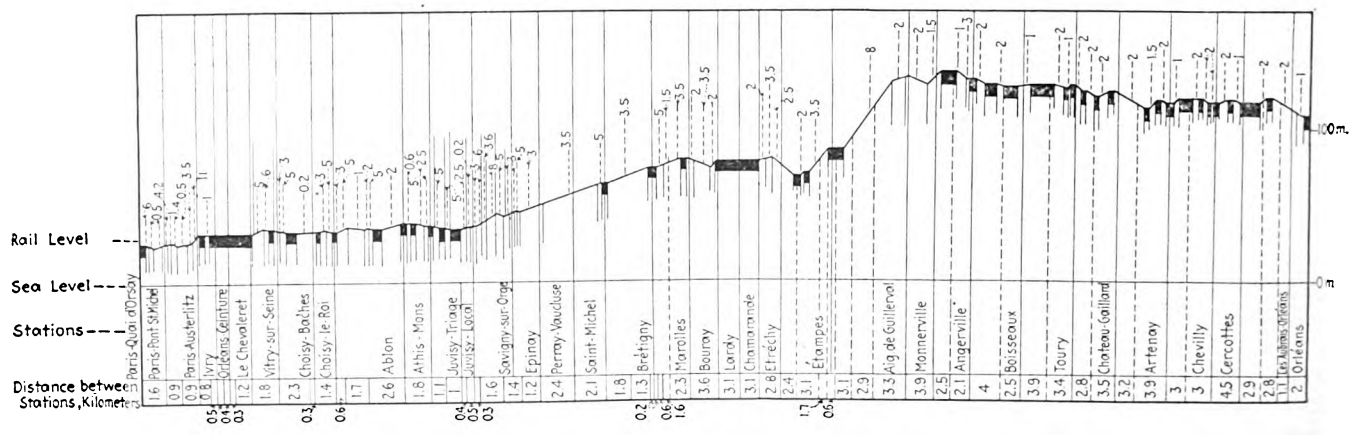
Orders had been placed in 1914 for locomotives to bring the total to sixteen when the outbreak of the war interrupted these improvements.

The Paris-Orleans, since the war, took up the interrupted work and, acting in conformity with the committee's recommendations, began the electrification of a total of about 143 route-miles, which include a revamping of the existing electrification Paris-Quai d'Orsay to Juvisy, an extension of the main line to Vierzon (one steam engine division) and a branch line from Bretigny to Dourdan. (See map.) About 25 miles of the route is four-track and the balance is two-track.

Power, it has been decided, will be supplied from a water-power station of about 40,000-kw. capacity on the Creuse River at Eguzon, about 70 miles from Vierzon, the southern end of the electrification. This power will be transmitted at 150,000 volts, over long distances, and 90,000 volts has been selected for the substation supply. Lighting and industrial load will be supplied along the line of the railway. Synchronous converters operating two in series on 1,500 volts direct current will be used for the transformation to direct current in each of eleven substations.

About 200 locomotives will be required, some for the present extension and the balance for a future extension south of Vierzon. The Paris-Orleans engineers are now studying the question of high-speed passenger locomotives and will make trials on several designs, among which will be a bi-polar gearless machine.

Some of the passenger locomotives will be required to handle certain trains known as "rapide," trains at speeds as high as 75 to 80 m.p.h.



PROFILE OF PART OF PARIS-ORLEANS RAILWAY INVOLVED IN FORTHCOMING ELECTRIFICATION

Digitized by Google

About eighty motor cars will be used on suburban and local trains. Some trailers will be used, the number of trailers in each train varying according to the service.

To Cover One Complete Engine Division

As previously mentioned, the extent of the contemplated extension of the Paris-Orleans Railway's present electrification will cover one steam-engine division for through trains and one suburban division. Thus the full advantage of electrification can be obtained in regard to the release of steam locomotives from the electrified division to other divisions, an advantage not secured when only portions of steam-engine divisions are electrified.

In addition to this, conclusive comparisons of operating results between steam and electric operation over the same division under European conditions can be expected, as it is anticipated that the traffic with electric traction will return to the pre-war density with steam power. The high pre-war train density on the Paris-Orleans Railway existing before the war on practically all lines serving Paris and its suburbs was occasioned by the large demand for transportation and the use of small cars for both passenger and freight traffic.

The grades from Paris to Vierzon are very easy, as is shown in the profile, the country being more or less rolling.

It is anticipated that in the future, the electrification will be extended from Vierzon to Limoges, the second present steam-engine division from Paris. Later some east and west lines of difficult profile such as Montlucon-Gannat, Brive-Clermont and Lomoges-Tulle will be added to the electrified system.

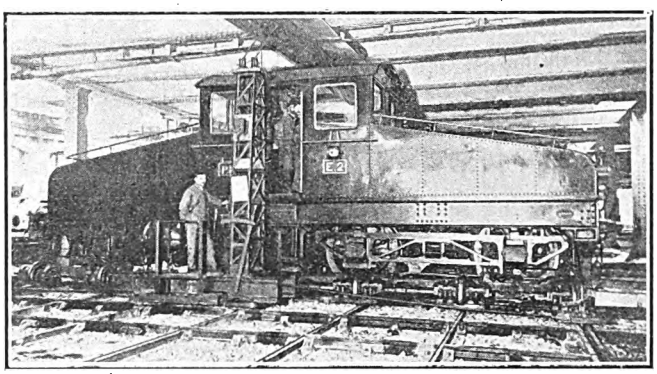
It will be seen from the foregoing analysis of the P.-O. that to date 14.3 miles of suburban lines have been electrified, operating eleven locomotives supplied with power by three substations. This system, originally built for 600 volts, direct current, third rail, is now being changed over to 1,500 volts. Contemplated and now under construction are 143 route-miles, including the present change-overs and taking in one complete engine division (Paris-Vierzon) as well as a branch line from Bretigny to Dourdan.

Coincident with the growth of electrification of the Paris-Orleans Railway, the Etat (then known as the Ouest) Railway was also developing plans for electrification. In 1900 a line was opened from Paris-Invalides to Versailles for suburban traffic. In 1913 the Etat planned a general electrification of all suburban lines with a total of 143 route-miles in addition to that already in service from the Invalides Station to Versailles, but the outbreak of the war halted the completion of the order. Since the war the Etat has placed orders for thirty locomotive equipments of 66 tons each. These locomotives, conforming to the national electrification plans, will operate on 1,500 volts and also on a reduced voltage of 600 to 750.

Midi and P.-L.-M. Railway Plans

In 1910 in the southern part of France the Midi Railway likewise began plans for the electrification of a substantial portion of its lines. Single phase at 12,000 volts, 16⅔ cycles, was selected and an experimental line of 29 route-miles between Perpignan and Vernet-les-Baines was installed. Shortly afterward the Midi equipped three short mountain branches on the Pau-Tarbes line with single-phase trolley. These three lines total about 43 miles. Since completion of the studies of the French commission, the Midi Railway has proceeded to change over to 1,500-volt direct current in conformity to the commission's recommendations. For the present the 1,500-volt electrifications will cover lines formerly operated at 16⅔ cycles single phase. Electrification is also being extended to other lines and orders have been placed for the electrification of nearly 155 route-miles.

Another great French railway, the Paris-Lyons-Mediterranean, began electrification from 1905 to 1910, electrifying a 24-mile line in a mountainous region between Le Fayet and Chamonix, at 800 volts, direct current. This was later extended an additional 19 miles. Before the war the P.-L.-M. was considering the electrification of three more lines of difficult profile. The most important of these is the Culoz-Modane line, preliminary studies of which have been begun. This



Electric Locomotive of Paris-Orleans Railway on Motor-Operated Transfer Table in Quai d'Orsay Station

line connects with the Italian State Railways from Turin and has grades as high as 3 per cent. Power will be purchased from private water-power companies at 42,000 volts, 50 cycles, and transmitted to the substations at 75,000 or 90,000 volts.

In the future the electrification of the main line from Lyons to Marseilles via Valence and Avignon will be considered.

Over 5,000 Miles to Be Electrified

From the foregoing it will be seen that the outstanding feature of all the proposed railway electrifications is that the question of system has already been decided and that valuable time will not have to be spent by each individual railway in fighting out the "battle of the systems." The French railways are thus in a fortunate position regarding the electrification of their lines. Only one frequency will be used for power transmission and the result should be a high state of apparatus standardization, since high-tension voltages have been standardized.

Among the three roads, P.-O., P.-L.-M. and Midi, it is expected that approximately 5,000 miles of route, mostly double-track, will be electrified within the next twenty years and later 500 route-miles or more will be added.

Since time does not have to be given to the question of system, and since the question of saving coal is so vital, we find French railways well advanced on a definite program that bids fair to place France as one of the leading countries in the world in amount of length of track electrified.

Do not the French railways furnish an excellent example for American railroads? At least they furnish food for much thought.

Saving Energy on the Long Island

This Railroad, Which Early Adopted Electric Operation for Part of Its System, Has Now Nearly 200 Miles So Operated—A Ten-Year Effort to Save Power Has Brought Satisfactory and Permanent Results

BY L. S. WELLS
Electrical Superintendent Long Island Railroad, New York City

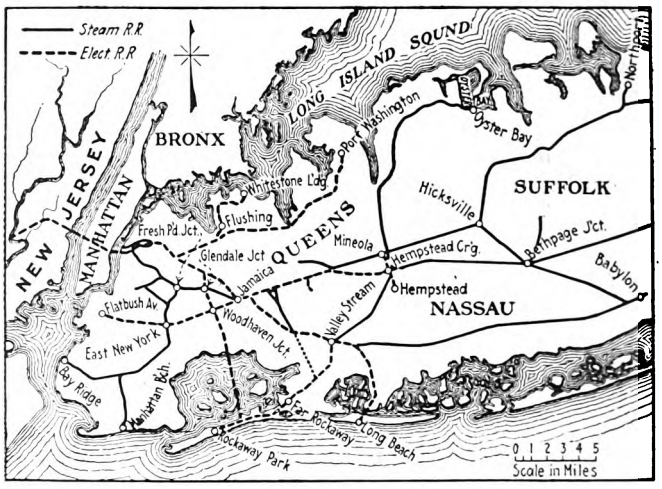
THE Long Island Railroad commenced the operation of multiple-unit trains on the lines extending from Flatbush Avenue to Jamaica and Belmont Park and from Flatbush Avenue to Rockaway Park, Far Rockaway and Valley Stream in 1905. In 1908 the electrification was extended to Hempstead and in 1910, with the opening of the Pennsylvania Terminal in New York City, the line between Long Island City and Jamaica was electrified and further extension made from Valley Stream to Long Beach. In 1912 and 1913 the Whitestone Landing and Port Washington branches were electrified. Since 1913 no extensive additions have been made to the electrified sections. The extent of the present electrification is shown on the accompanying map.

ELECTRIFICATION PERMITTED BETTER TRAIN MAKEUP

Power for the operation of the system has from the start been supplied from the Pennsylvania Railroad Company's power house, located on the East River at Long Island City. It is generated at 11,000 volts, three-phase, 25 cycles, and transmitted at the same voltage to substations, where it is converted to 650-volt direct current and fed directly to the third-rail sections.

It was early recognized that the change in form of motive power from steam to electricity in suburban service brought with it possibilities of changes in operating practices and methods which might result in marked economies in power consumption. For example, with steam-locomotive-hauled trains the unit of operation, not only from a traffic but also from a power standpoint, is the train-mile. To add or subtract cars from a train once made up called for a considerable amount of switching, with the result that at times of light traffic many empty or lightly loaded cars were hauled over the road. With the change to multiple-unit operation, with electricity as the motive power, the unit, from a power standpoint, became the car-mile, not the train-mile. The keeping of accurate records of the power consumption permitted the cost of power used in operating a car one mile to be determined, and the cost of operating empty cars could thus be brought forcibly to the attention of the operating staff. Cars could be added to or taken from trains with greater facility. As a result train lengths were varied to meet the traffic demands, better loading was secured and much dead mileage was eliminated.

With accurate records of power consumption, the effect of additional stops on the power consumption and thus on the cost could also be clearly brought out. The timetables and runs were studied with a view to eliminating unnecessary stops, and to making local stops where possible with trains of few instead of many cars. The transportation officials were led step by step to consider the effect of stops in making up



LONG ISLAND RAILROAD LINES IN WESTERN PART OF ISLAND

schedules and to scrutinize every request for an additional stop.

The electric cars are all heated by electricity taken from the power circuit. The great variation in power consumption between the summer and winter months soon brought out the large amount of power used for heating and the cost of providing this power. The steam trains were likely to be overheated, particularly in mild weather. As exhaust steam from the locomotive was available in almost unlimited quantities, the steam was turned on at the first signs of cold weather. Little, if any, attention was paid to its effect on the fuel consumption of the locomotive. With electrically heated cars, where the total power consumption was carefully watched, it was found that in cold weather, when all the heater switches were turned on, more than one-third of the total power consumption was being used for heating. This naturally led to closer supervision of heating. The car heaters are divided into three circuits, each controlled by a switch. Heater boards indicating the number of points of heat to be used are displayed at all terminals and a rigid inspection is made to see that the heater switches are being properly used and that no heat is being wasted. In addition, thermostats to control automatically the amount of heat used have been installed on many of the cars and their performance is being closely followed. The heating campaign has even spread to the steam trains and an effort is now being made to secure a better regulation of the heat in steam service.

ELIMINATING MINOR WASTEFUL PRACTICES

Another source of power waste was discovered in cars laid up in terminal yards. Air for brakes, operation of the multiple-unit control, etc., is supplied by motor-driven compressors. It was found that the switches controlling these compressors were frequently left in when cars were laid up. With the constant

Digitized by Google

leakage in the air lines, compressors on such cars would run much of the time. Heaters were also frequently left on in cars laid up for the night. A system was inaugurated of having all switches cut out when cars are laid up, and having them cut in sufficiently in advance of the leaving time to heat the cars properly.

The suburban traffic of the Long Island has two marked peaks, one between 7 and 9 a.m. and one between 5 and 7 p.m. During these four hours of the day about 40 per cent of the total daily energy requirement is used. To improve the load factor and reduce the maximum demand on the power system efforts are constantly being made to take all possible load off the peak hours. Train movements are studied with a view of eliminating all unnecessary movements and of postponing wherever possible until after the peak hours light movements between the yards and the terminals, etc.

Scientific Coasting Was Adopted Early

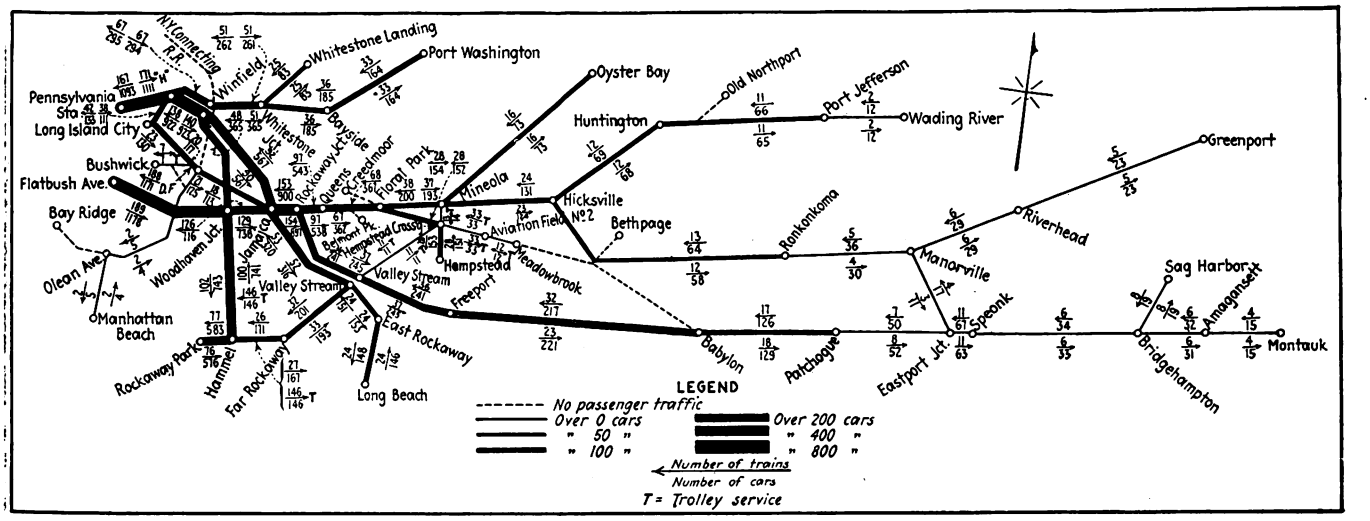
Following the power consumption closely as they did, it was natural that the Long Island officials should take great interest in the amount of coasting which could be done on a given run and to take means for increasing this coasting. In 1911, soon after the coasting clock or coasting-time recorder was placed on the market, a trial installation of ten clocks was made by the Long Island Railroad, five on the smaller or subway type cars, known as M.P.41 class, and five in the larger cars, known as M.P.54 class. At that time motormen were carefully instructed in the handling of their trains so as to secure the maximum amount of coasting. Shortly after the installation of the clocks, troubles of a minor nature developed which led to inaccuracies in the readings and nearly a year was devoted to changes and improvements in the clock mechanism. It was, therefore, not until the latter part of 1913 that accurate coasting-time records were secured. From that time on records have been kept of the coasting performance.

At the present time sufficient cars are equipped with coasting clocks to provide a car so equipped on each of a large percentage of the trains run. The clocks are punched and the paper with the coasting record removed by a member of the train crew and turned in by him with his time sheet. The slips are collected by the timekeeper and sent to the office of the electrical superintendent, where the record of each motorman is compiled. The motorman also turns in a small slip with his time sheet on which he indicates whether or not there is a coasting clock on his train, thus checking the performance of the trainmen in turning in slips. The records are kept on a large sheet by train and run numbers and summarized twice a month, the first summary being for the first two weeks in the month and the last summary for the entire month. This record shows the run number, name of motorman, running minutes, coasting minutes and coasting percentages. It is sent to the road foreman of engines. The assistant road foreman of engines, who is in direct charge of motormen in electric service, follows this record very carefully and whenever a motorman seems to be falling behind in his coasting, he rides with this man and endeavors to help him better his performance. Most of the men seem to take a keen interest in their coasting percentages and follow closely the records which they make from month to month.

Coasting Records are Used to Stimulate Pride in Good Performance

There are so many different kinds of runs and makeup of trains that no attempt has ever been made to offer any monetary reward or inducement for the best coasting record. Reliance has been placed on the posting of results and close following up of men with poor records to stimulate interest and get a better performance. Early in the campaign for increased coasting, certain coasting percentages were established for a great many different types of runs and an endeavor is made to bring the men up to this standard of coasting. The standards have been changed from time to time as conditions have changed. For example, as the increased use of trail cars in the makeup of multiple-unit trains decreases the rate of acceleration and thus the possible coasting percentage with a given schedule time, due allowance must be made for this fact.

From time to time special coasting campaigns, lasting for a week or two, have been carried on. During these campaigns special efforts have been made to get the maximum amount of coasting. The road foreman of engines and his assistants have ridden continuously over the road watching the performance of each individual motorman and making suggestions for improvement. The train crews have been instructed to



Traffic Chart for Typical Summer Day of 1921, Showing Numbers of Trains and of Cars on Different Parts of the Electrified and Connecting Lines

Digitized by Google

act promptly in opening and closing car doors, loading and unloading passengers on trains, etc., so as to reduce the length of station stops to a minimum. Attention has also been called to the proper method of approaching signals when in the "Caution" or "Danger" position, allowing the trains to coast slowly up to the signal rather than making a sudden stop and then notching up. In addition, towermen at interlocking and junction points have been instructed to route trains so as to reduce to a minimum the number of crossover movements; also to have routes set up and signals cleared prior to the approach of a train, thus allowing trains to move with the greatest freedom at such points.

In addition to the very substantial saving in power the increased coasting has reduced the duty on the motors and other car equipment. The M.P.54 type of car was originally designed for operation in trains of all motor cars. It was found, however, after several years of such operation that there was a considerable margin in the capacity of the motors, so that trailer cars could be added without overloading the motor equipment. The result is that longer trains are now made up with about 30 per cent trail cars. It is true that the close attention paid to coasting has been a material factor in permitting the use of these trail cars.

TABLE I—TRAFFIC AND POWER CONSUMPTION 1910-1921—LONG ISLAND RAILROAD

Year	Car-Miles	Ton-Miles	Average Weight of Car in Tons	Energy Consumption at Power House Energy Consumption at Power House for Traction Kilowatt-Hrs.	Energy Consumption at Power House Kilowatt-Hrs. per Car-Mile	Energy Consumption at Power House Watt-Hours per Ton-Mile
1910	6,934,244	280,324,080	40.9	31,750,000	4.588	113.4
1911	8,792,956	383,003,150	43.6	40,637,000	4.625	106.1
1912	9,836,211	438,404,725	44.6	47,040,000	4.791	107.4
1913	11,056,786	504,224,813	45.6	54,510,000	4.928	108.1
1914	12,600,339	592,723,272	47.0	64,510,000	5.116	108.9
1915	12,616,869	624,215,806	49.5	66,380,000	5.261	106.3
1916	13,541,108	679,259,104	50.2	72,220,000	5.320	106.4
1917	14,062,184	706,075,016	50.2	78,200,000	5.567	110.8
1918	14,209,184	723,355,454	50.9	78,710,000	5.545	108.8
1919	16,330,216	814,664,500	49.9	84,080,000	5.170	103.3
1920	18,456,744	906,698,948	49.7	94,050,000	5.100	103.7
1921	19,919,765	965,130,836	48.5	94,959,000	4.770	98.2

STATEMENTS COVERING TRAFFIC AND POWER CONSUMPTION

The results of the effort to control the power consumption on the Long Island Railroad are shown in the accompanying tables. Table I shows for the years 1910 to 1921, inclusive, the relation between the car movements in car-miles and ton-miles and the power consumption. In the fall of 1910 service was inaugurated into the Pennsylvania Station and the electric mileage about doubled. Previous to that year the cars used had been of the small subway type, weighing about 40 tons and run in trains, with wooden trail cars weighing about 21 tons. The equipment added for the Pennsylvania Station service was of the larger suburban type, similar to steam equipment, weighing about 55 tons and at first was run in trains of all motor cars. From 1910 on, the percentage of the larger cars increased. In 1914 the wooden trail cars were retired from service and in 1919 many steel trail cars added in trains with the M.P.54 cars. The result of these changes in equipment used is clearly indicated in the average weight of cars in tons, which rose to a maximum in 1918 and then fell off a little with the increased number of trail cars used. It is interesting to note the increase in power consumption in the two war years of 1917 and 1918, when there was less opportunity for closely supervising the operation from day to day.

TABLE II—COMPARISON OF ENERGY CONSUMPTION IN WATT-HOURS PER TON-MILE AT POWER HOUSE, MAY TO OCTOBER, INCLUSIVE, AND AVERAGE COASTING PERCENTAGE FOR YEAR

Year	Energy Consumption Watt-Hours per Ton-Mile	Coasting Percentage
1910	102.8	....
1911	96.1	....
1912	96.9	....
1913	97.0	....
1914	94.6	35.4
1915	94.6	36.6
1916	91.8	36.1
1917	95.6	33.6
1918	94.0	34.6
1919	91.0	33.3
1920	90.0	32.4
1921	88.3	33.2

Note greater number of trail cars operated in 1919, 1920 and 1921.

The energy consumption for the year includes that used for heating, which varies with the weather conditions and is thus not entirely under the control of the railroad. In order to eliminate the effect of this variation Table II has been prepared, showing the energy consumption in watt-hours per ton-mile during the months from May to October inclusive of each year from 1910 to 1921. In these months very little power is used for heating. For comparison, the coasting percentage is also shown in this table. This table shows the same increase in consumption during the war years 1917 and 1918 as is shown in Table I.

Table III has been prepared to show the relation between the traffic in ton-miles, the miles of main track electrified and the rated capacity of the substations during the years 1911 to 1921 inclusive. This shows that while a material reduction in the energy consumption per ton-mile has been made, the traffic in ton-miles per mile of electrified track has more than doubled. Similarly the ton-miles run for each kilowatt of substation capacity has increased over 60 per cent. This increase of traffic density has had a tendency to increase the losses in the system so that an increase in power consumption would have been anticipated rather than a decrease, the facilities not having been expanded in proportion to the increase in traffic.

AVAILABILITY OF CHEAP AND CONVENIENT POWER IS AN ASSET

The Long Island Railroad has taken advantage of the electrification of its lines to utilize the cheap power thus made available for many purposes. Of the total power supplied during 1921, namely, 115,747,710 kw.-hr., 94,958,710 kw.-hr., or 82.04 per cent, was used for traction; 11,418,000 kw.-hr., or 9.87 per cent, for the supply of subsidiary and affiliated railroad companies and tenants of railroad buildings, and 9,371,000 kw.-hr., or 8.09 per cent, for the operation of signals, lighting of stations, office buildings and shops, heating of small shelter sheds and ticket offices at outlying points and

TABLE III—TRAFFIC-MILES OF MAIN TRACK ELECTRIFIED AND SUBSTATION CAPACITY, 1911-1921—LONG ISLAND RAILROAD

Year	Ton-Miles	Miles of Main Track Electrified	Substation Rated Capacity Kilowatts	Ton-Miles per Mile of Electrified Track	Ton-Miles per Kilowatt of Substation Capacity
1911	383,003,150	158.50	36,500	2,418,000	10,500
1912	438,404,725	160.50	40,000	2,731,000	10,960
1913	504,224,813	174.08	46,000	2,898,000	10,960
1914	592,723,272	189.82	52,500	3,124,000	11,290
1915	624,215,806	191.59	52,500	3,258,000	11,880
1916	679,259,104	191.59	52,500	3,544,000	12,930
1917	706,075,016	193.60	54,500	3,648,000	12,960
1918	723,355,454	196.14	56,000	3,687,000	12,910
1919	814,664,500	197.62	56,000	4,126,000	14,550
1920	906,698,948	197.62	56,000	4,589,000	16,200
1921	965,130,836	197.62	57,500	4,882,000	16,780

Digitized by Google

as power supply for operating motors in the shops and other points where required. The saving, as compared with purchasing this power in small quantities at various points from local light and power companies or generating it locally in isolated plants, is most substantial. Furthermore, the presence of a cheap supply of power adapted to such usages has encouraged the use of many electrical labor-saving devices.

CO-OPERATION HAS PRODUCED GOOD RESULTS ON THE LONG ISLAND

The operation and maintenance of the power system of the Long Island Railroad, from the inauguration of the electric service, has been under the direct supervision of the electrical superintendent, who is also responsible for the efficiency and sufficiency of all classes of electrical apparatus or devices in the heavy electric traction, power and lighting system. He reports directly to the general manager. The electrical department, therefore, has been free to approach the problem of power conservation from the independent standpoint and co-operate to the fullest extent with the various departments interested. In the early period of electric operation some difficulties were experienced in persuading the operating officials and train crews to break away from old steam-railroad practices, but a campaign of education accompanied by reliable statistics of power consumption has been most effective. The continued co-operation and study of the operating problems, coupled with close supervision over a series of years, has made possible the reduction of power consumption outlined above.

Only through the closest co-operation between the officials responsible for the power supply and the operating staff can the full possibilities of electrification from an economic standpoint be attained. The proper adaptation of operating methods and practices to the use of electricity as a motive power achieved through such co-operation has, it is believed, had as much to do with the success of electrification on the Long Island Railroad as the particular system of power supply or any other single factor.

Studies made in connection with the operating and economic possibilities of electrification have quite naturally extended to other systems and have been helpful. Owing to the many variables entering into the question of power consumption, such as character of runs, grades, curves, number and location of stops, etc., it is manifest that any attempt to compare the performance with that of other electrified systems would be of little avail. Not only is this the case but the efficiency on a given railroad may be so influenced by operating methods as to further complicate such comparison and make it of little value.

Feustel Philadelphia Valuation Presents Valuable Analytical and Cost Data

Argues Against Reproduction Cost in Favor of Historical Investment—Past History of Company's Investment and Earnings Fully Analyzed—Would Not Allow Return to Capital for Good Management and Operation Now Adequately Paid for to Men and Management

THE report by Robert M. Feustel on the valuation of the Philadelphia Rapid Transit Company, briefly reviewed in the issue of this paper for May 27, is largely an argument against the use of reproduction cost as a measure of valuation of electric railway property and an argument for the use of historical investment as a more proper basis. The report, however, is filled with statistics and information which are of value to all electric railway companies. Mr. Feustel has devoted a large part of his report to a check of the company's reproduction figures and in so doing has set forth some very valuable figures on reproduction cost in general over a wide period of years. In connection with his historical investment figures he gives a complete report of all pertinent data with reference to the Philadelphia Rapid Transit Company. Summed up, Mr. Feustel's study brings him to the conclusions as to values which appear in the table on page 876 of the May 27 issue.

The report starts off with a discussion of the meaning of valuation, in which no particularly new ideas are expressed, but emphasis is placed upon the statement that: "The property valuation, so called, is necessary only as a step toward the real object sought for, which is the valuation of the service rendered by and with the property for the purpose of fixing a reasonable compensation for the service rendered."

While disagreeing with the use of reproduction figures as a basis and while not conceding at any stage the relevancy of the company's figure of reproduction cost, the city, through Mr. Feustel, has thought itself obliged to make a careful check of the items making up that figure. This, Mr. Feustel says, is to give the commission a reference basis from which may be developed a fair cost of reproduction figure which the commission, in its duty of considering all pertinent facts in arriving at a valuation to be used, may have before it.

Before starting that study, Mr. Feustel points out that although the company has chosen June 30, 1919, as the particular day upon which the valuation or reproduction figures are to be determined—prices as of June 30, 1919, being used—more than 95 per cent of the entire property was in place on June 30, 1915, so that less than 5 per cent was installed under war-time prices. To support this statement the report includes a chart of "Per Cent of Total Investment in Place Each Year," shown herewith as Fig. 1.

In checking the company's figures, Mr. Feustel has no quarrel with the company in so far as prices of material are concerned, but with the labor and real estate estimates he differs. The check with the city is carried in detail through the various accounts of the Interstate Commerce Commission's classification in a manner too detailed to outline in the limited space here available. On the general subject of property accounts, however, Mr. Feustel debates the use of the 15 per cent contractor's profit because upon his analysis he seems to find all services which this 15 per cent would pay for included, under other heads, in the accounts themselves. There are also a few items which are elimi-

Digitized by Google

nated from the inventory for various reasons which are discussed in detail. Issue is taken with the company regarding its interest-during-construction figures, determining that 10 per cent would be ample.

Summarizing his study, Mr. Feustel finds a difference of something over $65,000,000 between the company's figure and his figure, arriving at $187,553,326 as his estimate of reproduction cost June 30, 1919. Of the difference $14,000,000 is in paving; $3,500,000 is in unused property; $2,000,000 in land; $2,500,000 in grading; $1,160,000 in track and roadway labor; $900,000 in engineering; $500,000 in early organization costs; $850,000 in taxes; $6,500,000 in interest during construction; $14,000,000 in cost of financing; and he eliminates entirely the $15,013,644 loss of fair return claimed by the company. Thus more than half of the difference between company and city is in overheads.

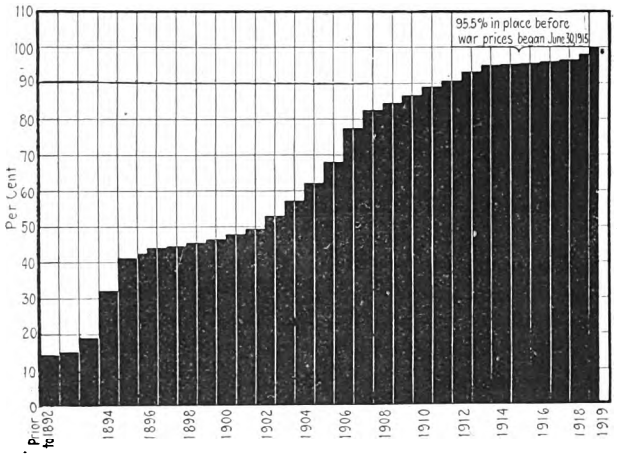


FIG. 1—PER CENT OF TOTAL INVESTMENT IN PLACE EACH YEAR 1892-1919

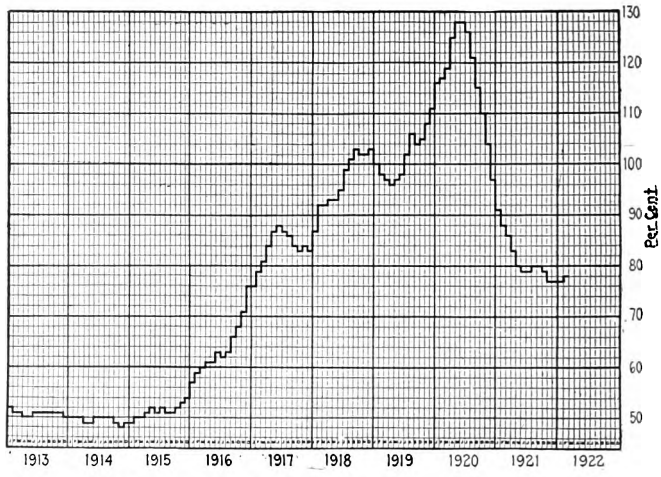

FIG. 2—TREND OF COST OF REPRODUCTION, MONTHLY VARIATION 1913-1922

DEPRECIATION MUST BE DEDUCTED

Mr. Feustel, however, is not satisfied to use reproduction cost new, but would deduct from that sum the depreciation which has actually taken place. In arriving at his depreciation figure, he has used the straight line method of theoretical physical depreciation, computed upon the estimated lives of the various elements of the property. He arrives at a figure of 3.23 per cent as the annual per cent allowance on the depreciable property. He presents in connection with his study on this question an elaborate table to arrive at the composite life of the property.

Having arrived at a figure for the June 30, 1919, reproduction cost, Mr. Feustel then turns his attention to an elaborate analysis of the variation in reproduction cost estimates, due to changes in prices. He finally evolves a curve showing the synthetic trend of cost of reproduction from which, having determined the cost of reproduction at any given date, he can find a multiplier with which he may multiply this figure to find the cost at any other date. He presents and studies a large number of the well known price indexes and other trend curves such as cost of living, cost of all commodities in various countries, etc., and then makes a detailed study of the trend of cost of reproduction of railway property. Taking June 30, 1919, as 100 per cent, each element in the cost of reproduction of railway property for the years 1905 to 1920 inclu-

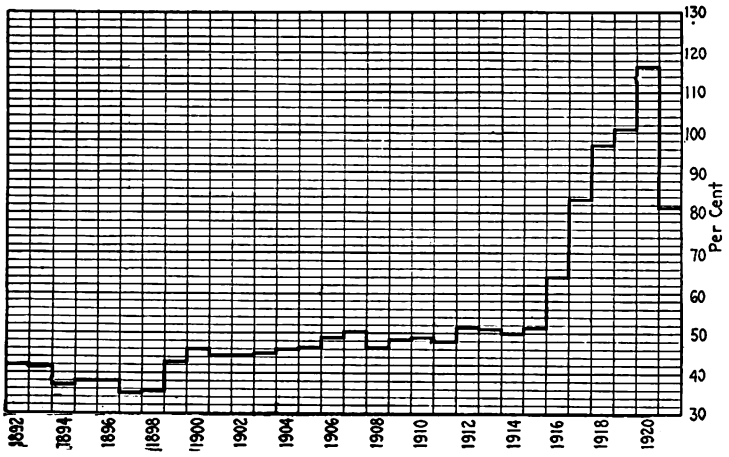

FIG. 3—TREND OF COST OF REPRODUCTION, ANNUAL VARIATION 1892-1921

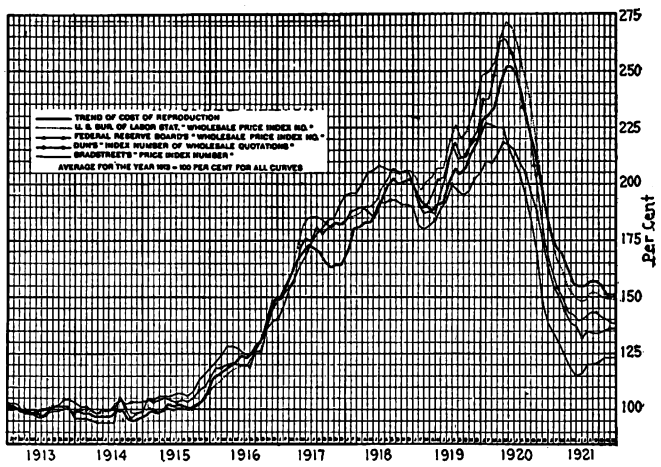

FIG. 4—TREND OF COST OF REPRODUCTION COMPARED WITH VARIOUS PRICE TRENDS 1913-1922

sive is listed, as shown by the accompanying Table I.

However, it would not be fair, he argues, merely to average these various items because some of them have a much greater weight in the total cost of reproducing the property than others. He has accordingly quite carefully worked out what he calls the "synthetic" trend by weighting each of the elements entering into the Philadelphia Rapid Transit property in the proportion in which each particular element is found in the property. Of the curves which he presents in this analysis three are presented herewith showing (Fig. 2) trend of cost of reproduction, monthly variation 1913-1922; (Fig. 3) trend of cost of reproduction, annual variation 1892-1921; (Fig. 4) trend of cost of reproduction compared with various price trends 1913-1922. All the quotations used in the construction of his trend are also shown in the report.

Using this trend of cost of reproduction curve, and using as a base his estimate of cost of reproduction as of June 30, 1919, physical property only, he finds the cost of reproduction of the physical property as of the first quarter of 1922 to be 78 per cent of that June 30, 1919, or $113,313,915. Adding overheads he arrives at a total cost of reproduction of $147,870,575.

REPRODUCTION THEORY UNSOUND

However, even after all of this study, Mr. Feustel finds and argues that the reproduction theory anyway is totally unsound for adoption in fixing a rate base and should be used by the commission, for good economic reasons, "solely as a collateral or reference figure, to test the sufficiency of the available investment figures."

Stating that the computation of reproduction cost is an estimate at best and based very largely on assumptions prescribed for the estimator, he argues that the best method of determining a rate base is to use historical investment. To support his contention that a reproduction cost as of any date is far from any adequate measure of what has actually gone into the property, Mr. Feustel presents two charts, Figs. 5 and 6 herewith, which are self-explanatory.

HISTORICAL INVESTMENT A SOUND BASIS

A rate base, however, computed on a record of cost or investment is not subject to the various objections of a reproduction cost. It is not an estimate; it requires no definitions as to dates; it is not subject to fluctuations in the level of prices; it requires no theoretical assumptions or hypotheses; it makes for economic stability; it is a fixed and constant landmark upon which a commission can safely found its judgment and to which it can safely apply the rate of return which, from time to time, it considers necessary from its knowledge of business conditions in all utilities, to accomplish the result sought to be attained, which is a reasonable rate of fare.

Mr. Feustel next turns to a detailed study of the

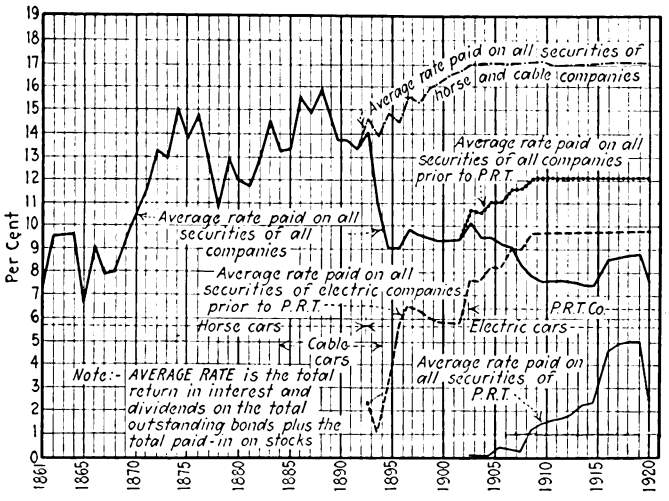

FIG. 7—RATE OF RETURN ON ALL SECURITIES P. R. T. AND ALL UNDERLYING COMPANIES

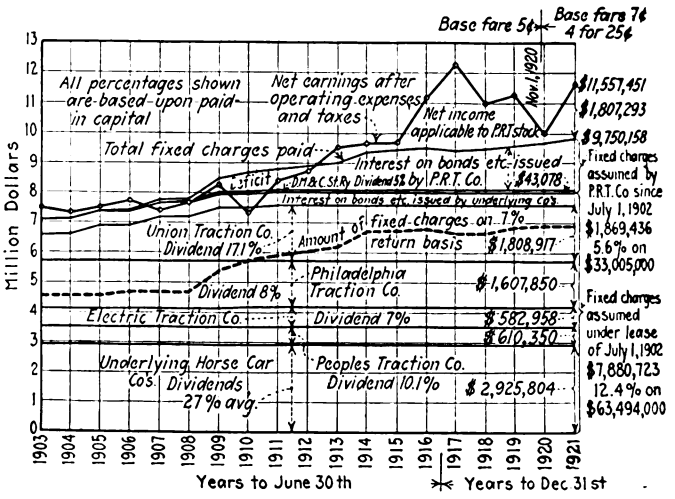

FIG. 8—NET EARNINGS AND FIXED CHARGES P. R. T. AND UNDERLYING COMPANIES

cumulative investment or historical cost and to a return on that investment. He finds it possible to locate practically the original records of more than 80 per cent of the figures necessary to determine these amounts. First he shows the very complex organization, comprising 122 corporate entities, of which the Philadelphia Rapid Transit Company is composed, and traces or states the facts with reference to the records of each of these companies. Studying this investment and bringing all figures into an adjusted total cumulative investment, he finds a total figure of $128,005,609.

This amount has been separated by periods as shown in Table II:

TABLE II—DIVISION OF HISTORICAL INVESTMENT INTO PERIODS AND GENERAL ACCOUNTS

1893–1896—Electrification of horse and cable lines		$32,619,558
1893–1896—New construction		948,512
1896–1902—Extensions and betterments—Union Traction Co., etc.		7,644,251
1902–1911—Construction of Market Street elevated subway		23,445,104
1902–1920—Extensions and betterments—Philadelphia Rapid Transit Company		41,040,120
1891–1892—Extensions and betterments—horse and cable lines		1,390,920
1860–1890—Total investment of all companies:		
In horse railway	$15,587,479	
In cable railway	3,679,884	
	$19,267,363	
Less extension and betterments, 1891–1892	1,390,920	
		17,876,443
Developed properties acquired by Philadelphia Rapid Transit Company since 1902.		
1902—Doylestown & Willow Grove Railway	$500,000	
1906—Darby, Media & Chester Street Railway	1,715,000	
1911—Chester & Philadelphia Railway	825,701	
		3,040,701
		$128,005,609

Of course the expenditures for road and equipment from the date of first incorporation of the first Philadelphia street railway in 1854 down to the year of 1890, amounting to $17,876,443, are not recorded in complete detail, although about 63 per cent of them are in reasonably complete detail and the rest in lump sums. As evidence of the reliability and completeness of the records, however, he points out that the total investment in horse railways of $15,587,479 is equivalent to approximately $47,250 per mile before adding anything for working capital. Of the total $128,000,000 Mr. Feustel finds about $20,000,000 of superseded property.

There is also presented a complete analysis of the capitalization of the company showing where the capital stock and bonds are owned. This table shows a total figure of $125,240,237 as being the entire paid-in capital of the Philadelphia Rapid Transit Company. Mr. Feustel also analyzes the profit from operation of the various companies from 1892 to date and shows elaborate tables of income, operating expenses, taxes and net available return from 1891 to date. As a conclusion, he finds that the net average return over the whole period, 1891 to 1920, was 8.90 per cent on the cumulative investment.

ORIGINAL COST AS INTERPRETED BY MR. FEUSTEL

Mr. Feustel then turns his attention to presenting a figure to represent the original cost. Original cost, as used by him, "is the figure obtained by applying to the present-day inventory of physical property unit costs for material and labor which were current at the time the different items under consideration were installed in service. There is included in this total, of course, allowances for the customary overhead charges." The inventory used was the same as that used for determining reproduction cost earlier in the study.

It was found that a very large percentage of the material prices could be determined direct from the book figures of the company. On this basis, the total physical property is found to be $84,433,785. Adding overheads, the original cost new is found to be $108,784,068. Again, this whole inventory is analyzed and discussed by account. In each case is told what part of the total account has been found on the company records. These percentages range from 60 to 93 per cent. The final table shows 69 per cent taken from records and 31 per cent estimated.

As the last element of his discussion on valuation Mr. Feustel takes up the question of "going value." He finds that no adequate definition of this was presented by the company although apparently it is asked for on the basis of a measure of early losses and argued for on the basis more of good will than of going value. To refute the claim of early losses and to analyze the earnings and fixed charges of the Philadelphia Rapid Transit Company, he gives a complete table on the return of total paid in capital from 1861 to 1920 inclusive, and presents two charts shown herewith as Figs. 7 and 8, giving the rate of return paid on securities and the net earnings and fixed charges. He states that the earliest lines started paying from the day they began operation, 7.48 per cent being paid in 1861 and an average of over 12 per cent being earned and paid from 1861 to 1890 on all the money invested in horse-car lines. With these and other arguments

Digitized by Google

Mr. Feustel tries to show the inadequacy of any such measure of going value. Again, if the going value is to depend upon consolidation and reduction in operating expenses which can be effected therefrom, it necessarily has an offsetting figure by the amount of investment in superseded and duplicate property taken over during consolidation.

Therefore, Mr. Feustel argues, if going value is to be allowed it might be used as offset to depreciation on original cost or as an offset to superseded property on the historical cost, or on some other basis. It would neither penalize the company on high past returns nor reflect on intercompany contracts. However, such an item is not for engineer witnesses to create; it is a device to be resorted to only by the commission.

FINDS NO "SUPER-MANAGEMENT" IN PHILADELPHIA

Two other elements make up Mr. Feustel's report. One of these is his discussion on the efficiencies of operation. Mr. Feustel says that most of the claims of the company for economies and efficiencies are based on comparison with antique methods in vogue ten years ago, and that in the main while the quality of service has been greatly improved, the volume of service available has not increased in proportion to the growth of the car-riding public. He points out that the operating methods in use by the Philadelphia Rapid Transit Company are similar to those used by other well regulated street railways and that service rendered riders in other cities compares favorably with that in Philadelphia.

Mr. Feustel does point out, however, that the relations between men and management on the property are excellent, and from this results a more economical and efficient service. "But," says Mr. Feustel, "the company's particular measure of this, in dollars of saving or intangible value, takes on the air of being some religious fetish rather than the presentation of facts showing actual results obtained from unusual operating methods." While agreeing that the service has been greatly improved over 1911 operation, Mr. Feustel says that this improvement was practically forced on the company. He gives the company credit for having efficient trainmen and for the co-operation which it has produced on the part of those trainmen. He also points out the excellent work of the company in its "Safety First" movement, saying that there is no doubt that it is in the front rank in this kind of work.

However, even admitting some of the efficiencies claimed for what Mr. Feustel terms "super-management," he says the men and management are well paid for their efficiency and that the car rider in Philadelphia is paying on the average certainly as much as car riders in other communities for similar service.

FIGURES 10 PER CENT SMALLER OPERATING BUDGET COMPARED WITH 1921

In his discussion of the operating budget Mr. Feustel is somewhat reluctant to make any definite prediction of what should occur in 1922, but for reasons which he presents he believes that the operating budget should be about $3,500,000 less than the company's 1921 expenditures, or $27,800,000.

Finally, turning to the rate of return, Mr. Feustel questions the usefulness of the testimony of bankers regarding rate of return. There are too many other factors to be considered, he says, one of the principal items being the specific method of calculating the valuation base. He criticises the present financial set-up of the Philadelphia Rapid Transit Company as being seriously unhealthy and unsound. With the present financial burdens which the company has to stand in the nature of its fixed charges, it is obvious that a 7 per cent return on any reasonable valuation would not even keep the company's head above water, but such facts as these can have no true bearing on determination of the fair rate of return; there are too many other things to consider.

Finally, Mr. Feustel can find no reason why there should be any departure from the Pennsylvania Commission's fixed rule of 7 per cent return.

A large number of statistical tables are appended to the report from which it is apparently possible to answer almost any detailed question of the past financial and operating history of the Philadelphia Rapid Transit Company and its subsidiaries.

New Type Indicating Instruments Designed

TO MEET the demand for small size indicating instruments the Westinghouse Electric & Manufacturing Company is now producing a new type known as Type "CX" ammeters and voltmeters.

These instruments are suitable for use on switchboard panels, for radio communication sets and other small charging and lighting panels. They are also furnished for use with a magneto to indicate speed and with search coils to indicate temperature.

These instruments are capable of standing vibration such as is found on railways without impairing their accuracy or reliability, a combination of ruggedness and lightness of moving parts being provided in their construction. The case is punched from sheet metal and is made moisture-proof.

An external zero adjuster on each instrument enables the operator to reset the zero position of the pointer if it is displaced due to transportation or shock. All parts are mounted on a molded sub-base, assuring sufficient insulation. The instrument is fastened to the panel by means of three machine screws furnished with the instrument. The standard finish is dull black marine.

The ammeters are self-contained for currents up to 30 amp., but can be used with external shunts for higher currents. The voltmeters are self-contained up to 50 volts, but can be supplied for higher voltage with external resistance.

New Paint Remover

A PAINT and varnish remover, which is a new product to the electric railway industry but has been used somewhat in connection with automobile painting, is being introduced by the Clean Wash Paint & Varnish Remover Company, Inc., Syracuse, N. Y. In a trial made by the Rochester & Syracuse Railroad, one man cleaned one-third of a large interurban car in one hour and fifty-seven minutes, using a little more than ½ gal. of the remover. At this rate one man can strip a car per day, using about 4 gal. of the remover, which would mean a saving of five man-days of labor and considerable material for this operation. Among the advantages claimed for this over similar removers now on the market are that it does not leave a coating on the surface and the wood does not retain the remover so as to produce any detrimental effect on the car or paint when it is repainted.

Railway Men in Historic Quebec

In Three-Day Meeting Canadian Electric Railway Association Considers Gasoline and Trolley Buses, Motor Design and Construction, Track Joint Welding and Valuation—First Manufacturers' Exhibit Exceeds Expectations — Major Burpee Elected President

BY FAR the most successful of the eighteen annual meetings of the Canadian Electric Railway Association was that held in Quebec City, June 1 to 3. Three hundred members and their friends, including a delegation of thirty or more from the United States, were in attendance. The latter group contributed both to the technical value and hilarity of the convention. The presence of "Americans" in such large numbers is explained by the fact that the executive committee of the American Association met in Montreal on May 31 and the Engineering Association committee on way matters met in Quebec on June 1 and 2, both of these meetings being arranged to bring about co-operation between the American and Canadian Associations.

A unique feature of the convention was the holding of the main and committee meetings, and the manufacturers' exhibit, in the Drill Hall, by courtesy of the Dominion Government. This was well adapted to the purpose, for the drill floor was of just the proper area and character for the exhibits, and an addition recently made provided, among other rooms, an excellent auditorium. It was located convenient to the Chateau Frontenac, the convention headquarters. The Drill Hall superintendent, Major Fecteau, contributed no little to the success of the meeting.

Thursday Morning Session

THE convention was honored at the opening on Thursday morning by the presence of Sir Charles Fitzpatrick, Lieutenant-Governor of the Province, and Hon. Joseph Samson, Mayor of Quebec City. Sir Charles showed a keen interest in the local traction situation, the difficulties of which, due to the topography of the city, he appreciated. He said that what the company lacked in equipment it made up in courtesy and good humor. In general, he considered the traction and power problems as substantially solved. While Canada is largely dependent upon others for coal, her water powers are well developed. But the housewarming problem is an acute one, and he hopes that electricity will play a part in solving it. Sir Charles pointed out how the prosperity of Great Britain and the United States have been largely due to wealth of iron and coal. Canada is handicapped due to lack of these, but is progressing nevertheless. The local power and transportation development under great difficulty illustrates this. While it seems a little incongruous to see modern electric cars in quaint old Quebec, they are doing a good work and are appreciated.

Mayor Samson traced briefly the early pioneer work in power development in Quebec and also felicitated the local company on its service.

Exhibits Officially Inspected

After these addresses the convention adjourned to the exhibit hall, where Sir Charles, Mayor Samson and the association officials were received by the exhibitors in turn and studied each exhibit in detail. Next, in the convention hall, President G. Gordon Gale delivered an address in which he congratulated the association on the results of admitting municipalities and manufacturers to membership. These he illustrated by statistics. He also advised the appointment of a permanent secretary.

Secretary's Report Shows Progress

Secretary L. E. Moreland's report contained a membership list of thirty-five active (railway) members and thirty-seven associate (manufacturer) members. He explained changes in the constitution and by-laws, drafted by the executive committee, to provide for four classes of membership: Active members, honorary members, associate members and associates; the last-named to comprise consulting engineers, commissioners and others not otherwise eligible. The annual fee for associates was set at $10. Instead of a flat fee of $100, the dues of active and associate members were placed on a graduated scale, varying from $25 for those with annual gross earnings under $100,000 to $150 for those earning over $1,000,000. An increase in the executive committee was also included to provide dominion-wide representation. (These changes were later ratified.)

Mr. Moreland also described the service activities of the association, involving questionnaires, legislation, technical studies, etc. A volume of proceedings covering five years (1916-1920) will, he said, be issued soon.

Next Honorary Treasurer A. Gaboury reported as to finances, showing the association to be prosperous. The amount on hand was about $7,600. Out of this convention and printing expenses must be paid, but there will remain a substantial balance, slightly less (said Secretary Moreland) than that of a year ago.

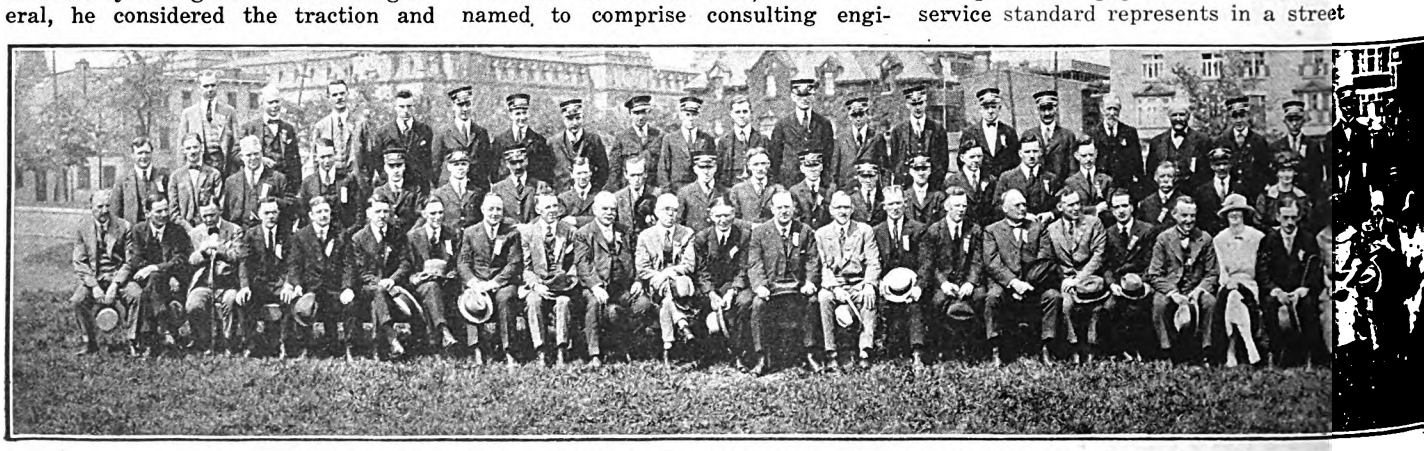
The morning session closed with the appointment of Past-Presidents Hutcheson, Eastman, Wilson and Gaboury (with Mr. Gale, ex-officio) as a committee to nominate the executive for the coming year.

Thursday Afternoon Session

THE paper on valuation by Dr. L. A. Herdt and Prof. E. G. Burr was read by the latter at the opening of the Thursday afternoon session. It is abstracted below.

Valuation of Street Railway Assets, Their Maintenance and Depreciation

The paper discussed the basis for appraisals of railway property and argued, in the reproduction cost method, for 100 per cent valuation. On this point the paper said that full service standard represents in a street



Members and Guests of Canadian Electric Railway Association Assembled in Convention in Quebec.

Digitized by Google

railway property not more than 85 per cent of the reproduction cost, as at no time is a property actually new and it begins to wear before it is placed in service. The 15 per cent difference between its reproduction cost new and its value representing full service standard has been employed in the public service, and the property could not exist if the company had not made this 100 per cent expenditure. Hence it would seem right that in rate cases the value allowed should be the value of the physical property new and that the only deduction for depreciation should be the amount required to rehabilitate the property to a full operating condition of standard efficiency. This would safeguard the public from paying a return on the new value of obsolete or worn-out equipment, while giving the company a return on the value of the equipment used in the public service. This suggestion, the paper points out, amounts to a depreciation only on obsolete equipment. Where rates authorized in the past have been insufficient to allow the company to replace obsolete parts, each case should be considered on its merits. In a large property it is often possible to provide for replacements in the annual budget and pay for them as a current expense. This has been adopted in the Montreal Tramways contract.

The paper quoted in full Article 92, paragraph 2 in the Montreal Tramways contract. This article provides for the establishment by the Montreal Tramways of a "maintenance and renewal fund," maintained by a definite charge on a car-mile basis, so as to amount to at least $500,000. Sales of worn-out and discarded property, but not sale of land and buildings, are paid into this fund, and all maintenance is paid out of it, as well as renewals up to the full reproduction costs of the unit or article. Additional cost, if any, and less cost, if any, are charged to or credited to capital value, and in the latter case is used for the making of betterments, additions to or extensions of the plant as ordered by the Tramways Commission.

H. E. Weyman, Levis, P. Q., opened the discussion.

Mr. Weyman said, in part, that the valuation of a property must be impartial if it is to be effective. The railways are entitled to "a living wage." At the same time there is little doubt that in many cases property has been allowed to depreciate much below a good operating standard. In that case the ordinary operating and maintenance costs increase in practically the same ratio as the property has been allowed to depreciate, the final result being rehabilitation at a cost out of all proportion with the saving made in maintenance in previous years. "A stitch in time saves nine" still stands as a good motto. The Montreal Tramways (to which reference was made in the paper) even in its darkest days never starved the property, or permitted maintenance to accrue, but what a different tale is told of other properties.

Mr. Weyman pointed out that in the paper depreciation is divided up between "physical" and "functional" and that 15 per cent physical depreciation is allowed without reduction in "reproduction cost." If the property has been maintained at 85 per cent of full service standard 100 per cent reproduction cost is the basis of the valuation. This, he said, is in itself an advance.

As to functional depreciation, which is obsolescence and accrued maintenance, when this is high some one is paying abnormal operating expense. If, however, adequate reserves for depreciation covering all accrued functional depreciation have been established, which means that the company has been granted an allowance through the annual depreciation charge and at the same time received a return on its investments, and if this depreciation has not been used to liquidate bonds or other indebtedness but employed in making extensions or betterments, a valuation or reproduction cost should be allowed. On the other hand, if the company has not taken care of functional depreciation, but employed its net to the advantage of its stockholders, then the valuation is effected by the amount of functional depreciation.

If the functional depreciation is not taken care of, the bondholders are not properly protected. It is essential that careful and proper accounting be employed. A property or plant ledger should in all cases be employed, together with a perpetual inventory, and the functional depreciation should be taken care of in this ledger. Such records ought to aid in securing fair treatment at the hands of public authorities. Functional depreciation is an expense and should, as pointed out in the paper under discussion, be deducted from gross revenue before net profits are determined, and not from net profits. Finally Mr. Weyman suggested that a committee be appointed to consider the standard classification of accounts and the including of depreciation in its various forms as an expense account. This was referred by the chairman to the incoming executive.

Electric Railway More Than a Utility, Says Montreal Commissioner

Mr. Weyman was followed by Judge J. F. St. Cyr, chairman Montreal Tramways Commission. He explained the practical workings of the Montreal franchise, and said that the city was not keen for municipal operation, desiring rather to have co-operation. The electric railway was recognized not only as a utility but as a necessity. Hence it must be maintained at the highest possible standard of efficiency. Under this condition no allowance for depreciation is needed, but replacements may be capitalized at the added cost; that is, the difference between replacement and original costs. Hon. A. B. Ingram, chairman Ontario Railway and Municipal Board, said that under the jurisdiction of the board when rates are fixed, changes in valuation are referred to an independent board of valuators.

Speaking for the London (Ont.) Street Railway, Leonard Tait, secretary-treasurer, said that this property has been operating for a fare of seven tickets for a quarter, but that permission to charge 5 cents has just been granted. Previous to 1917 no fund for depreciation had been accumulated, but now an equivalent is provided in the requirement of its $1,500,000 mortgage, due 1935, that 5 per cent of the bonds be retired annually. A $300,000 depreciation fund has been built up.

How Motor Design Has Been Improved

The second paper was on "The Modern Electric Railway Motor," which was read by the author, J. K. Stotz, Canadian Westinghouse Company. It will appear in a later issue. Mr.

THIS PICTURE WAS TAKEN IN FRONT OF THE DRILL HALL, ILLUSTRATED IN THE ISSUE OF THIS PAPER FOR MAY 27

Digitized by Google

Stotz amplified his formal paper slightly by enlarging on the subject of safeguarding commutator leads against breakage. He said that the fundamental requirement is to prevent vibration and concentration of stress. Careful binding, use of phospor-bronze sleeves, minimizing of bends, proper varnishing and baking, etc., all help.

In opening the discussion, W. G. Gordon, Canadian General Electric Company, said that his company has just completed a census of all street railway motors operated in Canada. This shows that 8,066 of the older type motors and 3,362 of the more recent type, with either series or parallel ventilation, are in use.

Experience with winter operation of the fully ventilated motor indicates that with the multiple ventilation satisfactory results are obtained by closing the intake openings at the commutator end of the motor frame. In some cases closing a portion of the exhaust openings in the pinion end of the motor frame is beneficial also.

To indicate the care with which motors are made, Mr. Gordon said that while the exterior of the modern railway motor may suggest ordinary workmanship, it is doubtful if any other line of machinery manufactured has closer fits and more accurate workmanship. Some of the tolerances in armature shaft fits are "plus 0.00025 in to minus nothing." For framehead fits in box-frame motors, "plus 0.002 to minus nothing" is allowed. The thread fit for framehead bolts and for screws is made so close that special taps and dies are required to insure tight-fitting threads. All of this is necessary because imperfectly fitting parts rapidly loosen and wear in the abnormally hard service to which railway motors are subjected.

Helical versus Spur Gearing

While disclaiming that he "held a brief" for spur gearing, Mr. Gordon said that complete comparative data can only be obtained after the helical gearing has been proved by extended trials over a period of several years.

Accurately cut helical gears running on correct centers and with shafts in true alignment will run quieter than ordinary spur gears. These, however, are conditions which do not usually prevail in the operation of railway motors, due to wear of armature-shaft and axle-shaft bearings. With helical gears it may be found advisable to renew bearings more frequently than with spur gears.

With straight-cut teeth endwise movement of the motor frame or armature shaft relative to the axle and gear does not produce any change in speed of the armature. In actual practice there is always more or less endwise movement of the motor along the axle and the armature shaft through its bearings. This movement results in a change in position of the pinion across the face of the gear, parallel to the axle. When such movement takes place with helical gearing it results in a quick change in speed of rotation of the armature, resulting in shock and vibration. As flange wear of armature shaft and axle linings, and wear of armature shaft and axle thrust collars, permit a change in position of the pinion across the face of the gear, it will probably be found advisable to adjust thrust collars and change linings more frequently than is required when straight cut spur gears are used. Helical gears cause an increase in end thrust and consequently wear of thrust collar and flange wear of lining will probably be increased with helical gears.

In considering gear noise it should be borne in mind that this is only one element in the noise of a running car and that some reduction in gear noise may not make a noticeable difference in the sum of the noises coming from the car. Further, an accurately cut helical gear should not be compared as to noisiness with an inaccurately cut spur gear. The vibration and shock resulting from well-cut spur gearing reasonably well maintained is small in comparison with the vibration and shock resulting from other causes such as rough tracks, curves, crossovers, switches, flat wheels, trucks, cars, braking, acceleration, etc.

At the instant when a tooth in a helical pinion begins or ends engagement with a tooth in a gear there is but a point contact. Even when helical gearing is in full and perfect mesh a tooth in the pinion has but a comparatively short bearing on its mating tooth in the gear. If the gear centers are separated the length of this bearing is shortened. At the extreme point of separation when the gear just goes out of mesh, there is but a point contact between the pinion tooth and the gear tooth. This condition prevails even when the axle and armature shafts are parallel. With a straight cut gear the length of contact between the gear tooth and pinion tooth is not changed by increasing the center distance between pinion and gear.

With straight cut spur gearing, assuming parallel shafts, there is a bearing between the pinion and gear tooth for the full length or face of the gearing regardless of inaccuracies in spacing of teeth due to imperfection in machining. Therefore, there cannot be less than one tooth in contact for its full length. As previously stated, with helical gears each tooth at any given instant has but a comparatively short contact with its mating tooth. If, therefore, there is inaccuracy in the spacing of the teeth there is but one tooth in contact and that but for a short length.

It is doubtful if a new helical cut pinion can be used on a worn helical cut gear with as little trouble as can a new straight cut spur pinion be used on a worn straight cut spur gear. Should difficulty be experienced in meshing such helical cut gearing it would materially shorten the life of the gearing. In changing motors or armatures it may be found that helical gearing will not satisfactorily interchange but that pinions and gears which have run together should be kept together.

In actual practice it is questionable whether helical cut teeth will prove to be as strong and reliable as straight cut teeth. When helical teeth are worn, imperfect meshing will be more pronounced then with straight cut gears. Whether or not helical gearing will have a life equal to spur gearing can only be determined by years of trial of a large number of helical gears under the widely varying conditions of operation which prevail in electric railway service.

In conclusion, Mr. Gordon said that while in no way condemning the use of helical gears with railway motors, he felt that such points as those mentioned should be considered.

Commutator Slotting Not New

In further discussion of details of Mr. Stotz's paper, W. R. McRae, Toronto Transportation Commission, said that commutator slotting was necessarily practiced on the early Vandepoele generators because the insulation was red fiber. He said that 7½ to 8 lb. per sq.in. brush pressure is used in Toronto. The only difficulty he foresaw in connection with helical gearing was collar wear due to end thrust. This may be eliminated possibly by proper lubrication of collars. The helical gearing on the Toronto Civic Railway's safety cars was otherwise satisfactory.

W. H. Sawyer, East St. Louis, Mo., said that commutator slotting was tried by the General Electric Company many years ago. The principal characteristic of the modern motor, in his opinion, is its "balance"; that is, the appropriate relative capacities of armatures, field coils, etc. While some details, such as oiling, still need improvement, executives ought to appreciate the great expenditure which the manufacturers have made in research.

Another speaker on this subject was T. C. Berkelay, English Electric Company, who said that the ventilated motor is new in England. Development has had to proceed in view of the facts that English railway men are conservative and that several track gages are in use. The company has developed three motor types (with both split and solid frames), and of these Mr. Berkelay gave some details. Bearings are packed with waste mixed with 10 per cent long-strand horsehair. Only one brush per holder is used. Banding is found to prevent commutator-lead breaking.

In conclusion, and in response to a suggestion by Mr. McRae that a committee on standardization of helical gears be appointed, Mr. Stotz said that the American Electric Railway Engineering Association is looking into this matter. He favored standardization and the making of engineering studies, but is convinced from operating data of the superiority of helical gearing.

Friday Morning Session

THE subject of the trackless trolley was the first one taken up on Friday, the discussion being opened by a paper by D. E. Blair, Montreal Tramways.

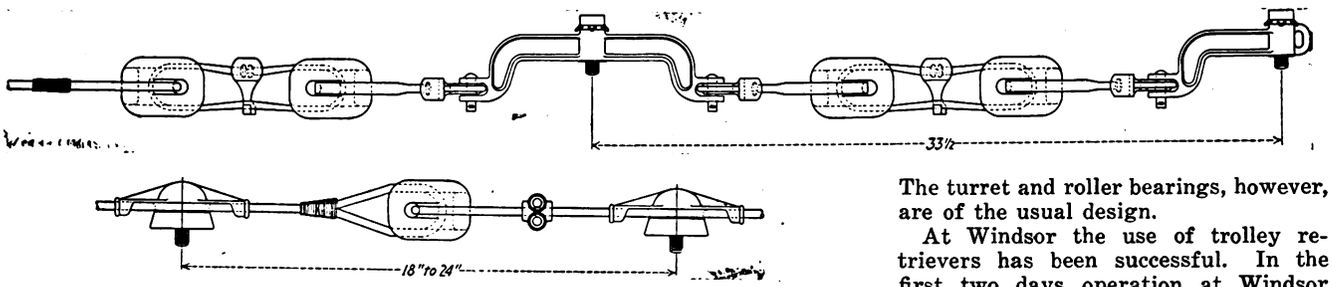
In his paper Mr. Blair gave a series of questions which must be considered in deciding the wisdom of using buses as auxiliaries to an electric railway. It is only in auxiliary service that he favored their use. There are many examples, he said, of rail lines upon which service is maintained only in view of commission rulings, contracts, etc. A decision in favor of the bus or trackless trolley in such cases will be involved with track renewals and regradings. Sometimes, also, passengers can be carried cheaper by direct bus lines rather than car lines which involve a roundabout route. Mr. Blair's paper will be abstracted at length in the issue of BUS TRANSPORTATION for July.

He supplemented the paper by stating that bus operation has come to stay and that the art of carrying passengers on rails has not been progressing as fast as that of carrying them in independently propelled units. As for the maintenance of bus engines, this will not be troublesome with good mechanics and intelligent operation. The experience of the Fifth Avenue (New York) Coach Company shows this. It is corroborated by Mr. Blair's experience in driving one automobile 65,000 miles in six years with no equipment trouble. Buses were introduced reluctantly in Montreal, but they were cheaper than rail lines for the particular service to be given.

The first two buses used in Montreal were turned over to men inexperienced with buses, but they were able to keep them up for two and one-half years, and the cost was 8.9 cents per bus-mile in 1921. The tires cost 2.88 cents per mile, as compared with about ¼ cent for car wheels. The troubles experienced were about the same in number and severity as with street cars. As a result of experience and study Mr. Blair did not see any possibility of successful competition of buses with street cars, their field being only supplementary thereto.

The discussion of Mr. Blair's paper opened with another paper, on the trackless trolley, by M. W. Manz, Ohio Brass Company. After referring to the general situation regarding this type of vehicle he said that the trackless trolley will usually be operated by street railway companies. Seldom will the operation of the trolley bus reach such magnitude that it can carry the additional overhead which would be imposed by the maintenance of a separate operating organization. Hence a prime requisite for overhead and collection should be that the materials and construction should be as nearly standard as possible.

Overhead can be laid out with standard overhead materials for reliable operation when two harps, two poles and two bases are used. This principle is illustrated in the automatic trolley reverser used on railway cars in Bradford, England, and in the collecting devices used in Leeds, England, and Shanghai, China, on trolley buses.



OVERHEAD FOR TRACKLESS TROLLEY. ABOVE, PULLOFF SUSPENSION FOR CURVE BELOW, CROSS-SPAN CONSTRUCTION

In some trolley bus installations one base has been used for two poles but in the later English installations separate bases as well as separate poles are generally employed. Where the two elements are interconnected, each one is very directly affected by a disturbance in the other.

In the swiveling type of harp being used by the Windsor Hydro-Electric Railways the center of the spindle passes through the center of the axle for the wheel. This assures that the center of pressure as transferred from the base will align itself with the wheel in any position of the base. It is essential that the wheel rotate freely without trailing or caster action.

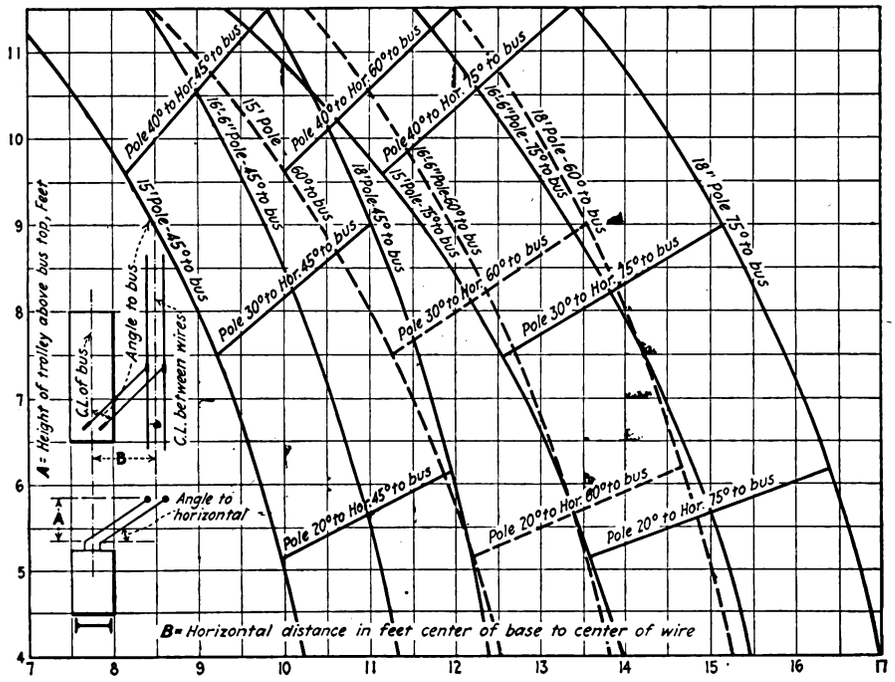
A by-pass takes the current from the wheel to the motors. To reduce pitting to a minimum a piece of No. 0000 solid copper is carried from the contact springs on the wheel down through the center of the spindle to contact with the finger to which the motor lead is attached.

The harp is insulated from the pole by means of a bakelized canvass tubing, plugged at the end and projecting down over the pole.

The trolley base used at Windsor can be operated when spaced about 16 in. center to center. Its narrowness is due to the arrangement of the springs. The turret and roller bearings, however, are of the usual design.

At Windsor the use of trolley retrievers has been successful. In the first two days operation at Windsor considerable difficulty was encountered at two insulated crossings. The retrievers proved their ability to protect the poles and the overhead while operating through this special work at a rather high rate of speed. After the second day at Windsor there were no dewirements for the first two weeks of operation.

With the swivel harp the overhead materials may be kept standard, excepting at frogs and crossings. The only difference there is that springs are added to the frogs and crossings to provide a positive operation in the direc-



A SET OF CURVES FOR USE IN SELECTING TROLLEY BUS POLE LENGTH

Digitized by Google

tion intended. The swivel harp is so sensitive that its tendency to continue in a straight line makes the matter of a turnout a rather difficult problem unless springs are employed.

The type of suspension which is being used at Windsor is shown in the accompanying illustrations. The lower shows the tangent suspension as used, excepting that there is an insulated bolt hanger and a porcelain with a serving as is shown at the left of the insulator, the Crosby clip method of attachment at the right side being a merely suggested arrangement. This suspension gives triple insulation between positive and negative wires. The wire spacing is approximately 24 in. on tangent and 32 to 33 on curves.

The curve suspension being used at Windsor is as shown in the figure, except that only one strain insulator is used next to the curve pull-over.

In the selection of trolley-pole length the trolley pole should be at an angle of about 30 deg. with the horizontal. Thus with a bus 8 ft. wide in a 28-ft. street, the distance from the center of the bus to the center of the wire would be about 10 ft. From the accompanying curves, it appears that a 16 ft. 6 in. pole would fulfill these conditions when it made an angle of 45 deg. with the bus. With a swivel harp it is easily possible to operate 60 deg. to the bus at a moderate speed and even 70 deg. may be approached in case of necessity. If an 18-ft. pole made an angle of 60 deg. to the bus and one of 30 deg. to the horizontal, the trolley wire would be necessarily about 9 ft. above the top of the bus and it would be possible to operate the center line of the bus 13½ ft. from the center of the wires, or with the wires 17½ ft. from the curb.*

The Technical End of Motor-Bus Construction

The discussion of Mr. Blair's paper was continued by G. Gordon Bell, vice-president Eastern Canada Motor Truck Company. He took for his topic the features which require consideration in selecting a motor bus. He said that from the large number of inquiries received by his company he confidently expected the bus to be used extensively as an adjunct to street railways.

In designing a motor bus, said Mr. Bell, there are two prime factors to consider, economy in operation and strength with minimum of weight. These factors are interdependent.

The motor truck has been, and still is, largely used in bus service, but as it is not designed for this particular work it is not suitable therefor. The features to be incorporated in a properly designed bus, in addition to those mentioned, are: Flexible and long springs, preferably with some system of progression to take up loads as they increase. As the machine will be operating over good roads, the chassis frame can be lowered considerably without jeopardizing ground clearance. Frame to be wide enough to suit a bus body. Track of rear wheels to be wide enough to facilitate low floor level and non-interference of wheel race with seating arrangement. Machine to be geared to suit the particular conditions over which it is to operate.

Mr. Bell emphasized the importance of proper gearing. To achieve the most economical results a machine must be geared for its particular run, or for runs over which the gradients will be approximately equal. The machine designed by the company for the Toronto Transportation Commission was geared without information as to the particular run over which the machine was to operate. An 8:1 ratio was used at the outset, but later a 7:1 ratio was used, with a saving in fuel of about 20 per cent.

On the subject of tires and wheels, Mr. Bell said that the solid tire with non-skid tread is most applicable for city use. The cushion wheel adds slightly to the weight, but gives easy riding qualities which are worthy of consideration. Cushion tires are satisfactory for the light machines, up to probably thirty passengers, but have not been developed sufficiently for machines of greater capacity. The pneumatic tire, with the probability of delays due to punctures and its greater expense for renewals, is not a profitable investment, except for suburban runs over rough roads, where its advantages in reducing shock to the machine over the solid tire and the greater speed at which the machine may be driven are apparent.

L. H. Palmer, United Railways & Electric Company, Baltimore, Md., reviewed the five years of motor bus operation there. His conviction is that cars can serve the public best, even in London and New York, but supplementary service with buses by the railway has a place. The company is extending its service, and on a new line will charge 10 cents fare and in general furnish seats for all. Baltimore will soon start a 6-mile trackless trolley extension. A decision as to type of overhead collector has not yet been reached. This will supply service to a real estate development, and the real estate people have put up $32,500 to cover the deficit of the first five years. Three buses have been purchased. The railway company would have preferred gasoline buses, but the promoters wanted the tangibility of the overhead construction. The bus situation in Maryland is simplified by the heavy state tax imposed.

Windsor Heard From Also

Experience with the trolley bus line in Windsor was described by W. R. Robertson of the Hydro-Electric Power Commission of Ontario. The commission collected a vast store of data on the subject, from which the conclusion was reached that the trolley bus is the most economical system of transportation possible, even though a 10,700-lb. bus costs $1 per pound as compared with 50 cents for a safety car. While gasoline motive power lasts but 100,000 to 125,000 miles, electrical equipment fails only through obsolescence. Electric power is cheaper, also. In Windsor the overhead cost $5,000 per mile.

In Winnipeg bus operation cost 25.71 cents per mile total, or 22.52 cents without depreciation and interest. In Minneapolis the total cost was 37 cents. In Richmond, Va., trolley-bus operation cost 13.2 cents and in Norfolk, 16.31 cents.

In Windsor the controlling factors were simplicity, safety and maximum of strength with minimum of weight.

The bus discussion closed with free-for-all rapid-fire contributions. Mr. Ingram explained the workings of his commission. W. G. Naegal, Canadian Brill Company, explained details of buses furnished to Toronto. Mr. Blair stated that the life of a well-maintained gasoline engine is practically endless. Mr. Palmer emphasized the importance of adapting engine equipment to operating conditions, stating that the per-gallon mileage in Baltimore had been increased from 5 or 6 to 9 or 10 by this means.

Canadian National Safety League

The morning session closed with an appeal by J. F. H. Wyse, representing the Canadian National Safety League, for more active co-operation from the railways. The Ontario League started in 1913, largely under Mr. Ingram's inspiration. Four years ago the larger organization secured a Dominion charter. Accidents have, as a result, been reduced or minimized. A motion for a committee on this subject was referred to the incoming executive.

Friday Afternoon Session

RAIL joints formed the topic for discussion on Friday afternoon. E. B. Entwisle, chief engineer Lorain Steel Company, read the paper which is abstracted elsewhere. It covered experience with the Johnson bar-weld joint and the more recent Jacobs joint. As engineer of maintenance of way for one of the largest users of the bar-weld joint, H. H. George, Public Service Railway, said that hundreds of these joints had been used successfully in open track. Surface-bent joints, badly pounded, had been reclaimed by their use. Expansion joints, staggered, are placed every 500 feet. These joints are made of split switch points. It is, said Mr. George, important to eliminate space between rail ends in all welded joints.

W. F. Graves, Montreal Tramways. said that his company is now trying the arc-weld joint. A stretch 2,700 feet long has been welded and furnished with one expansion joint. It has gone through two winters without breaks. A 1,000-ft. section of open track shows the same result. Rail ends are butted, a 24-in. flat steel bar is bolted firmly into position, and seam-welds are made top and bottom. Mr. Graves

*A more extended treatment of this subject will be found in an article by Mr. Manz in BUS TRANSPORTATION for June, 1922.

Digitized by Google

said that much depends on the welderman, who needs a sixth sense for this work.

W. W. Wysor, United Railways and Electric Company, Baltimore, Md., said that his company also has used a number of arc-weld joints. He finds much variety in practice in this field and is trying to determine the best for use in Baltimore. Next came G. F. Gailor, Rail Welding & Bonding Company, Cleveland, Ohio, whose company is recommending a carbon-arc process. He said that as a result of extensive research work and of the reports of the service men who visit companies using the process, he expected soon to be able to give the industry some helpful suggestions as to procedure.

E. M. T. Ryder, of the Third Avenue (New York) Railway and vice-chairman of the committee on welded rail joints, said that an important thing to be determined in arc weld and thermit joints is the effect of the high temperature in welding. This the committee is undertaking, to meet the need for metallurgical data. Funds will be solicited for this work. It will be done under the most competent auspices.

Asked by Mr. Ryder as to the experience of his company along this line, Mr. Entwisle said that after a joint is made the rail must be heated for several feet from the joint to say 1,500 deg. F. to dissipate the localization of the heat effects. The stresses set up caused breakage until the post-heating practice was adopted.

How the Thermit Weld Produces a Continuous Rail

The discussion was closed by R. L. Brown, Metal & Thermit Corporation, who asked: "Is there a permanently standard joint?" He said that there is not, for a standard is only such until something better comes along. It is well to close the gap in a joint. The thermit insert weld, as well as the Jacobs weld, does this. In the former the joint is opened up a half inch and an insert which fills this space is slipped in. The melting action of the thermit does not extend to the rail head, but the fused insert is welded to the section below the head.

Saturday Morning Session

AT THE closing session of the convention, held Saturday morning, George W. Lyndon, president Association of Manufacturers of Chilled Car Wheels, showed by motion pictures the process of manufacturing chilled wheels. He said that there are 25,000,000 wheels in use and that the association members can produce 30,000 wheels per day. In manufacture each wheel carries a serial number, with or without the name of the customer, and a record is kept of its characteristics.

Business Session Last

Business matters were then taken up. Don M. Campbell suggested Toronto for next year's meeting. R. M. Reade, Quebec Railway, Light & Power Company, explained how the exhibits had been arranged for. He backed up Mr. Wyse regarding the Safety League and said that in Quebec the cost due to accidents is only 0.7 per cent of gross earnings.

Resolutions of thanks to all contributors to the success of the meeting were passed, and the following were elected to the offices named:

Honorary president, E. A. Robert, president Montreal Tramways; honorary vice-president, W. C. Hawkins of Hamilton; honorary council—Col. J. E. Hutcheson, Montreal; T. Ahearn, Ottawa; Acton Burrows, Toronto; G. Kidd, Vancouver; president, Major F. D. Burpee, Ottawa; vice-president, H. H. Couzens, Toronto; executive committee—E. P. Coleman, Hamilton; C. L. Wilson, Toronto; A. W. McLimont, Winnipeg; R. Mayne-Reade, Quebec; W. L. Weston, Halifax; D. W. Houston, Regina; A. Eastman, Kingsville, Ont.; H. E. Weyman, Levis; W. R. Robertson, Toronto; honorary treasurer, T. Hart, Three Rivers; auditor, Col. G. C. Royce, Toronto.

Major Burpee then took the chair, and said that attention would be devoted even more than before to preventing duplication of the work of the American Association. The desire is to concentrate on Canadian problems, particularly with reference to promoting better relations with patrons.

Among the Exhibits and Exhibitors

Exhibits in Drill Hall During Canadian E. R. A. Convention

THE association initiated at this convention the plan of holding an exhibit, which was so successful that it will be continued. The exhibits were arranged around the walls of the Drill Hall and in a double row down the center.

In the space available here it is impracticable to go into detail regarding the exhibits. Some of the new things shown will be described in later issues of this paper.

It was fortunate for this first exhibit that the use of the Drill Hall involved no rental cost, so that there was no charge to exhibitors for space. The hall was divided off by light railings, constructed and painted by employees of the transportation department of the railway. It was hung with flags, many loaned by governmental departments, others rented.

While the exhibits this year numbered only about thirty-five, they were well worked out to show the latest developments in track, overhead, motors, control, car details, metering, etc. They fitted in well with the points covered in the technical discussion. Exhibitors said that the railway men studied the exhibit details in a gratifying manner. The associate members showed their appreciation of the work of R. M. Reade, Don M. Campbell, A. Gaboury and Peter J. Quinn, who composed the exhibit committee by the adoption of resolutions and the presentation of gifts to the local men who had stood the brunt of the work.

A part of the exhibit feature which occurred in the convention hall was the presentation of motion pictures by the Canadian National Safety League, the Canadian Westinghouse Company, the Shawinigan Power Company and the Association of Manufacturers of Chilled Car Wheels (which has been mentioned earlier).

Social Features of the Convention

THE attendants at the convention were given many excellent illustrations of Canadian hospitality. On Thursday a get-together luncheon at the Chateau Frontenac served to break the ice. This was followed by a sight-seeing tour of Quebec for the ladies, and afternoon tea at the Drill Hall, There was also a rousing banquet in the evening, followed by dancing.

The dinner was the occasion of many felicitations, being unique in the attendance of President R. I. Todd and Executive Secretary J. W. Welsh of the American Association, President L. H. Palmer, of the Transportation and Traffic Association, President F. E. Webster of the Accountants' Association, President C. S. Kimball of the Engineering Association, Charles L. Henry, and other guests from the United States. Following the English practice, the toast list opened with one to the King, and this was followed by toasts to the guests, the ladies, the association and the press. The hits of the evening were made by Charles L. Henry, Chief of Police Emilio Trudel of Quebec and Acton Burrows. Brief talks were made also by Col. J. E. Hutcheson, Major F. D. Burpee, R. I. Todd, J. W. Welsh, F. J. Neil, Charles L. Wilson, G. Gordon Gale, Don M. Campbell, Frank Carrel, editor of the *Daily Telegraph*, Quebec; Col. George C. Royce and H. H. Norris.

On Friday afternoon a boat trip was taken to the famous Quebec Bridge, with music and refreshments on board, followed in the evening by a reception and ball at the Chateau. On Saturday morning special cars took the ladies to Montmorency Falls and the Shrine of St. Anne de Beaupré. For all of the occasions requiring music this was furnished by the Royal Canadian Artillery Band, from the Citadel, under the direction of Capt. Charles O'Neill.

Electric Resistance Welded Rail Joints*

New Butt Weld Proves Successful in Philadelphia, Boston and Elsewhere—Bar-Weld Joints Now Number More than 800,000

By E. B. ENTWISLE
Chief Engineer Lorain Steel Company, Johnstown, Pa.

WHEN girder rails were introduced in the United States in 1884 there was also introduced the problem of joints. It required a dozen years of use of this rail to prove that its life depended not so much upon the chemical proportions of the steel or the quality of its supporting ballast, as it did upon the character of the joints.

This paper deals with the type of joint known as the electric resistance joint of the Lorain Steel Company, the successor of the Johnson Company of Pennsylvania.

More than 800,000 Bar-Weld Joints Installed

This form of welding first took shape about 1894 and was designed to unite two rails with a bar 7 in. long on each side of the web, with contact against the web at the extremities of the bar. The current was passed through these contacts which were welded to the web. The first of this type of welding was done in Boston on what was known as the Providence rail, the joint then in use being a casting which received the foot of the rail, with a wedge driven along one side to hold the rail and casting together. Later and more successful designs of electrically welded splice bars replaced the first type, and with few alterations have been the standard for twenty-five years.

The bar-welding with head support, if done on new rail with no splice bar holes, is 18 to 22 in. long, 3¼ in. wide and 1½ in. thick, of mild steel. On old rail the bars are long enough to extend beyond the old bar holes. To prepare the bars for welding they are heated and placed under a drop hammer which forces a pear-shaped portion of the metal above the surface of the bar at each end and a strip 1¼ in. wide across the bar in the middle. These three areas are the sections welded. A head support about 4 in. wide is welded to the bars at the time the middle weld is made. This is also welded to the side of the rail head, and to the web.

For twenty-five years this process has been carried on, until now there have been welded more than 800,000 joints distributed among the principal cities of the United States, and many repeat orders testify to the estimation of its value held by those who know it best. A repeat order for the fifteenth consecutive year of one of the largest traction companies has just been entered.

Bar-Weld Joints on the B. R. T.

The process has been successfully applied to open T-rail construction on the Myrtle Avenue line of the Brooklyn Elevated Railway. Here the track is exposed to rapid changes in temperature of the air, without the aid of the earth to absorb and dissipate the accumulated heat. An experimental installation of 370 joints was made in December, 1914, and January, 1915. A recent inspection of this track shows that four joints have been removed on account of breakage through the rail, one other showing fracture through the welded bar, and eight other joints were slightly defective due apparently to failure to fill up the openings between rails with shims when the weld was made. This installation after seven and one-half years of service is still carrying the traffic with a minimum maintenance cost as to joints.

Joint failures can be accounted for on the hypothesis of power shortage during the moment of welding, or overheating, or imperfect alignment and surfacing of the rail prior to welding, or contraction of the rail localizing at the joint.

A few examples of percentages of failures will serve to show the value of this form of joint as a maintenance proposition. An installation of 1943 joints in 1917-1918 on 7-in. new girder rail had five breaks. A later installation of 3,833 in 1919 to 1921 has no breaks to date. This is a record of one-tenth of 1 per cent.

Six miles of 56-lb. T-rail track laid in macadam with one rail uncovered to the ties was welded ten years ago and an inspection this month reveals no broken joints.

Another large installation covering about seventeen years, for the Public Service Railway of New Jersey, required 130,158 joints. There have been welded in Chicago since 1907 a total of 184,423 joints on the standard Chicago rail, which weighs 129 lb. per yard and is 9 in. high. In these joints the percentage of breaks during the first six years was 2.74, and the average for nine years was below 1.5 per cent. This improvement, to quote from the report of the board of supervising engineers, Chicago Traction, was brought about "by the combined efforts in improving the workmanship of the weld and by the more uniform conditions of power supply which became available as the work proceeded."

Latest Development Is the Butt Weld

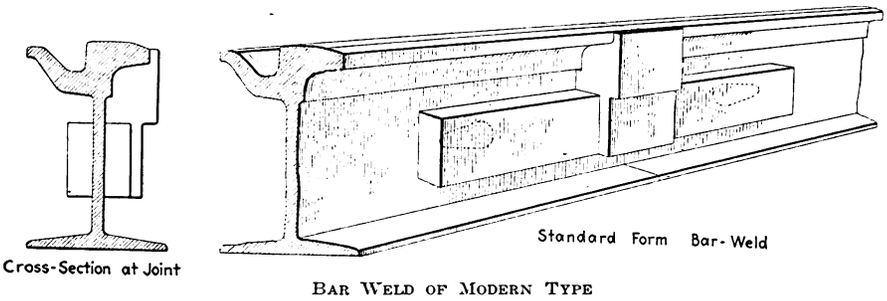
The Lorain Company is now operating under the Jacobs patents on a butt weld. This process contemplates bringing the milled ends of the rails together and welding them without the aid of bars. This was the process aimed at by the predecessors of the company back in 1893-1894, but their engineers were unsuccessful in achieving what apparently today is the 100 per cent joint.

The butt-weld process consists essentially in a method of heating the end, or abutting surfaces of the rails to be joined, by having them in contact with a liquid flux which is heated to a high degree by the passage of a comparatively small electric current through it, and a powerful clamp against the rails, operated by a hydraulic pump, for forcing the rails together, end to end, after the ends have been brought to a welding heat. The apparatus is mounted on two trolley cars, the first of which contains a 30-kw. motor-driven alternating-current generator, an air compressor, a furnace for melting the flux and a reheating torch. A switchboard with all necessary meters and regulating apparatus is also provided.

In the process the rails are spiked to a few ties to hold them to gage and to insure a fair surface and alignment, and an opening of about ½ in. between the ends. The rail clamp and crosshead are then adjusted so as auto-

*Abstract of paper read at the annual convention of the Canadian Electric Railway Association, Quebec, June 1 to 3, 1922.

Digitized by Google



BAR WELD OF MODERN TYPE

matically to bring the two rails in line with each other. A spacer is set between the rail ends and a preliminary pressure of 5,000 lb. per square inch is applied before the molds are set in place. When the molds are set the cable terminals from the generator are clamped to the crossheads and the current is passed through the flux, which has previously been melted and poured into the mold. The current in its passage through the flux heats the ends of the rails to a high degree above the welding heat of steel, and when this point is reached, which requires about three and one-half minutes, the pressure is applied, the rails are forced together and simultaneously the current is cut off. At about a half minute before a welding heat is reached, the current reaches its maximum when about 1,650 amp. is taken at about 40 volts. No oxidation in the weld is possible, as the rail ends are completely immersed in the flux and no air can reach them.

Immediately upon the application of full pressure the top mold is taken off and the hot metal which has extruded at the weld is hammered across the head, thus producing a forging effect to obviate any tendency that might exist to soften the rail at the exact point of weld.

Scleroscope tests show that the portion which has been heated and hammered is actually somewhat denser than the parts of the rail that have not been heated. The pressure holding the rails together is maintained until the weld has cooled below its critical temperature, when the reheating torches are applied and the flame is directed to the center of the web, directly against the weld, and it is reheated to about 1,500 deg. F. This relieves any strains that may have been set up due to the end pressure or other causes.

About § in. of each rail is combined in the weld, the extruded metal being ground off the head and tram. As a continuous operation about three welds an hour can be made on 9-in. rail.

The first experimental butt welds were made in Pittsburgh, Pa., in December, 1919, and in Johnstown in the summer of 1921 on the tracks of the Johnstown Traction Company. Ninety-three welds on 134-lb. 9-in. girder rail were made, making two rails each 2,700 ft. long. About one-half of this track was sprung into a curve and was not paved in for several weeks. Yet there was no distortion under constant operation, and no breaks have occurred.

In Boston, 504 welds were made in 1921 on four different rail sections. In Philadelphia 402 welds on 9-in., 141-lb. rail were made within the last year. In this process, due to the single track operation in that city, the welding apparatus was set on a motor truck, the rails being laid on top of the paving outside of the track, which was being operated over by the railway, and sections from 1,000 to 1,500 ft. long were welded, and were afterward set over into the track in their permanent position.

The advantage of the process is due to the fact that the entire cross-section of the rail is welded, without the addition of any other metal. While special conditions require special treatment, there are no difficulties which cannot be overcome, and they are more than compensated for by the permanency of the result. There has been but one failure in more than 500 joints welded in Boston, five joints in more than 400 welded in Philadelphia, and none in Johnstown where ninety-three joints were welded.

Electric Railway Credit Returning*

BY JOHN A. PRESCOTT

Prescott & Snider, Kansas City, and
Vice-President Investment Bankers' Association of America

THE financial results of operations of the electric light, power, gas and electric railway companies for the calendar year of 1921 generally indicate a marked improvement in credit and again prove the inherent stability of the utility business as a whole during a period of serious business depression.

There also is marked improvement in the actual appreciation in the market values generally of both senior and junior securities of utility companies.

Companies enjoying good credit are now able to sell senior securities at rates of interest much lower than during the previous year. In fact, the cost of such financing to those companies which have the highest credit is already at a point where such companies can afford to consider making important extensions. The other important determining factors naturally are reasonableness of the construction costs and the probability of being able to provide for a part of such costs through sale of junior securities, as well as from undistributed earnings.

To a limited extent, we are now witnessing junior financing, particularly in localities where public understanding has resulted in relief from inequitable burdens and the granting of rates adequate to assure a stable interest return and steady dividends based on proper property values.

Vast sums of new capital are needed by all utilities. The amount required for electric railways and the electric light and power properties alone had been estimated at $1,000,000,000 per annum for the next five years to be used in replacements, refunding obligations, extensions and improvements. This is indicative of the similar needs of all, merely to care for postponed construction and to keep pace with community growth.

This financial problem is made more difficult by the present system of federal and state taxation. The large investor, who in the past was chiefly called upon to furnish funds for the industry, cannot now afford to buy taxable securities. The industry must, therefore, find new sources of capital among investors whose contributions are so small as not to be seriously affected by federal or local taxation of their securities.

It is urged that investment bankers devote more attention to the development of markets, particularly for junior securities, in the communities served, not only to make available this additional source of capital, but also because the benefits derived therefrom, in the solution of many of the serious problems affecting the industry, can hardly be overstated.

While considerable progress has been made in restoration of the credit of the power and light companies particularly, the process of readjustment has been somewhat slower in the gas and electric railway industries because of the greater difficulties which these industries have in readjusting rates, service and operating costs. The recent experiences in Des Moines, Iowa, and Saginaw, Michigan, and other places have demonstrated that the use of the jitney, the automobile bus and the trackless trolley never can replace electric railways. These vehicles are being recognized as useful accessories to existing electric railway transportation systems, but no more than that. Furthermore, it should be understood that managements of companies engaged in supplying an electric railway service are experts in urban transportation and as such will naturally adopt improvements as experience and the requirements of the service dictate.

We wish to call particular attention to those facts as indicating the fundamental soundness of the electric railway business. It is as essential as light and power services, and in the interests of the public welfare, must be assured as sound a financial basis as they.

*Abstract of interim report of the committee on public service securities of the Investment Bankers' Association of America, dated May 4, 1922.

Digitized by Google

In this connection attention is directed to what appears to this committee as an unfortunate and perhaps an invidious comparison frequently used by investment bankers in making offerings of securities. Stress is often laid upon the small percentage of revenue derived by a corporation from transportation service. The natural inferences from such arguments are likely to react unfortunately and retard the full restoration of credit of the public utility companies as a whole, because, after all, they are all based upon the same fundamental principles, to wit: the rendering of essential services at reasonable costs upon the assurance that investors will receive a fair return on honest investment value in the business.

In this same connection, we recommend great care in the preparation of offering circulars by investment bankers, to make the statements of financial facts and conditions so complete and clear as to enable both dealers and investors to analyze correctly and easily the securities offered. Perhaps a real service might also be rendered by encouraging the publishers of statistical and rating manuals to exercise greater care in making the information they contain complete, comprehensive and accurate.

Examination of the statements of many public utility companies will disclose a startling increase in the proportion of net income paid out for taxes. The ability of a public utility to render satisfactory service is of paramount interest to its public and much more important to the community it serves than any revenue which may be derived from burdening it heavily with taxation. On the other hand, the margin of safety for capital invested in an enterprise is greatly reduced by excessive direct and indirect taxation, and must inevitably be paid for in increased rates.

Furthermore, there are many cases of gross injustice. We cite only one, merely to illustrate. Counties and road districts are freely issuing tax-exempt bonds to build hard-surfaced roads to parallel long existing steam and interurban electric roads rendering good and essential service. These parallel, hard-surfaced roads are certainly of no benefit to the utilities. They are worn out by competing freight trucks and bus lines which usually contribute practically nothing to their construction or upkeep. But the utilities not only are invariably taxed to the limit to pay for the construction and maintenance of these competing roads, but are further penalized by reason of their taxable securities having to compete in the investment markets with the tax-exempt municipal road bonds.

Since, in theory, taxes are paid for protection and benefits, there is a peculiar irony in compelling the heavily taxed and strictly regulated public utilities to furnish the fundamental facilities to their practically tax-free and unregulated competitors. If the public thinks its interests require this sort of competition, we believe it should at least rectify this gross injustice by requiring these competing, and usually irresponsible, free lances to secure certificates of public necessity, take over from the public utility companies all the tax burdens now borne by them for the construction and maintenance of hard-surfaced roads, and submit to as strict regulation and requirements of responsibility for the public safety as are now imposed upon the utilities.

It must be evident to students of taxation that public utilities, whose opportunities for profits are reduced by public regulation to practically an interest basis, the quality of whose services and the range of whose activities are closely supervised and circumscribed, cannot be equitably taxed upon the same basis as industries or properties whose opportunities for profit are legally unlimited.

In view of the fact that some of the states are about to hold constitutional conventions for the purpose of drafting new state constitutions, it is particularly timely and opportune for investment bankers and operators of public utility properties to discuss the fundamental questions affecting the taxation of both public utility properties and securities. Inasmuch as the constitutions of most states provide for the equal taxation of all classes of property, both real and personal, upon the same basis of valuation and levy, in order to provide equitable forms of taxation applicable to different forms of property, it is necessary to lay a proper foundation in new constitutional provisions.

It would seem, therefore, a wise policy for our association at this time to propose and urge the incorporation in state constitutions of provisions for the classification of property for purposes of taxation, so that each class may be dealt with differently and equitably, and also in such manner as to produce for the governmental authority the greatest returns and benefits economically consistent. Such constitutional provisions would serve as foundations for sound systems of state and local taxation, affecting both public utility properties and the securities issued by the companies owning them.

Distance Fare Is Logical Railway Rate*

Readiness-to-Serve Charge Is Desirable but Difficult to Apply—Flat Fare Has Worked Hardship on Public as Well as Railways

By Henry L. Doherty

WHEN I look back on the public utility business I wonder that it has not had more trouble than has ever come to it. The basic economic problems which underlie nearly every form of public service have never been understood by a large portion of the public utility operators and have been totally disregarded by most all of them, even though they have been understood.

We must recognize that we are giving a service and not simply selling a commodity; that equity of charging is more important than simplicity of charging, and that methods of charging which can only be justified on the grounds of simplicity can be economically so unsound as at least seriously to handicap the business if not ruin it.

The expenses of being ready to give service are always present, although in some lines of business, like the street railway business, it may be hard to charge on a readiness-to-serve basis. Giving service here consists of having a car come down the street every five, eight, ten or twelve minutes, whether anybody is there to ride or not. If we were simply to run all cars carrying no passengers whatever, our expenses would probably be 80 per cent of what they are when carrying passengers. So, in a way, 80 per cent of all the expenses of a street railway are readiness-to-serve expenses and 20 per cent represents the actual cost of carrying passengers.

How to apportion these readiness-to-serve expenses among those who are benefited is a difficult matter, although there are ways by which regular and frequent riders can be premiumized. Some of the railroads are using an identification card which gives the holder a lower rate than the prevailing rate of fare, charging a fixed amount per month for the card. This gives a fixed charge plus a low rate of fare.

Passenger transportation is a necessary part of our city life. It could even be argued that it is a common expense which all property owners should bear. I have suggested on one or two occasions that it would not be inconsistent for the public to pay a part or even the entire readiness-to-serve expenses of a street railway company, raising such a fund by a property tax. An example which illustrates the justice of this is the gentleman who lives outside of a city and uses his own automobile exclusively. Nevertheless, much of what is necessary to maintain his home depends upon street railway service, not simply the errand boy and house servant, but many other things as well.

I have always been an advocate of a distance system of charging with a fixed loading and unloading charge; that is, a small charge to represent loading and unloading with a fixed charge per unit of distance of riding. I have always been told that such a system was impractical, but I see no reason to think that it could not be worked out in a very satisfactory way except for lack of interest on the part of street railway men. The flat 5-cent fare, to my mind, has worked a harm

*Abstract of address before annual dinner of the Connecticut Section, A. I. E. E., New Haven, May 23, 1922.

Digitized by Google

that not only applies to the street railway companies but to the public as well. The meager transportation facilities in many of the European cities, which, however, seem adequate, can only be explained by the fact that anything in the nature of a distance system of charging tends enormously to increase the capacity of the transportation vehicles by encouraging short rides, and this in spite of the fact that many of the European zone systems are hopelessly faulty.

The proper system of distance charging would tend to keep the workman who is employed in the suburb living in that same suburb instead of having him perhaps cross the entire city to reach a district settled by his own type of people. It would also cause people to do more of their shopping in their immediate neighborhood and would give us the very desirable thing in civic life of less congestion and yet less transportation demand.

THE PAST POLICY IN REGULATION TREND

It has been only a few years since public utilities were indiscriminately subjected to competition. After many decades the public concluded that it was a sufferer by this competition and then solemnly resolved that best service and lowest rates could be had by the public by doing away with competition. The public said: "By natural law you should be a monopoly and we are going to make you one in fact, but if we do this we must regulate your earnings." We accepted this because there was nothing else we could do, and the fashion swept across the country of passing regulatory bills and creating public service commissions. And yet this work was hardly under way before the street railways were subjected to the most unfair sort of competition. Along comes the jitney and the public forgets all about the fact that we have had all profits above a nominal rate taken away from us for a period of years on the theory that being a monopoly we were not entitled to any more than a meager rate of return.

So we are again drawn into competition, and yet our competitor bears none of the expenses of being ready to serve the public. Our competitor simply carries passengers when it pays to do so. The taxpayer provides his road and cleans his streets and yet he takes enough of the cream off our business perhaps to make the whole undertaking unprofitable. The lesson once learned by the public has soon been forgotten. We have paid the price for immunity from competition only to find that we did not have even a sound crutch.

Then again the public has always been imbued with the idea that when we are allowed to earn a certain rate of return, that that is equivalent to being guaranteed that rate of return. This is one of the exceedingly unfair features of regulation as now practiced, because we are guaranteed nothing except that excess profits will be taken from us and that we will be left to bear our losses alone. In most cases excess profits, instead of being reduced by lowering rates, should be used to reduce the relation of capital to property value, perhaps even to the extent of bringing the capital down to the junk value of the property.

One thing we do need in the public utility business, no matter to which branch it relates, is an empowering act enabling the public service commission to fix an initial rate for a long period in advance, and then permit the company to earn all it can over what is now considered a reasonable rate of return, with the provision that these earnings shall be divided between it and its patrons. This is done in a measure by the South Metropolitan Gas Company of London and is known as the London sliding scale. It was initiated, I think, by Sir George Livesey. But in my opinion, the profit sharing with the patrons, wherever possible, should be done as a declaration in dividends rather than by lowering rates from time to time.

Pennsylvanians Discuss Competition

Association in Twenty-first Annual Meeting Devotes Main Consideration to the Problem of the Bus—Commission Chairman Tells Railways They Must Use Buses—Light-Weight Cars for City and Interurban Service Also Treated

W. D. B. AINEY, chairman Public Service Commission of Pennsylvania, told the men gathered at the banquet of the Pennsylvania Street Railway Association, Harrisburg, Pa., on the evening of June 1 that the problem of motor bus competition is very largely a matter that must be solved by the railways themselves. They must understand that the coming of the bus will be a competitive service unless its coming is guided to make it a complementary and supplementary service to the existing rail systems. If the railway men do not measure up to this aspect of the situation and do not give the public the bus service that is wanted, then neither legislature nor commission can save the railways from the new competitor. He considered that the bus in some respects represents an advance in the transportation art. It is something that the people want, and hence it is bound rapidly to find a field of service. Of course, he said, the bus must pay its just share of the cost of constructing and maintaining the roads used, for it is manifestly unfair for the railways, as very large taxpayers, to bear these burdens for their competitors. He emphasized the need for giving consideration to the human element in the transportation business —the business of meeting the wishes of the riding public. He said that in the main Pennsylvania companies have caught the key to the human element, with the result that they are enjoying fairly good public relations.

In his address to the association at the morning session on June 1. President T. B. Donnelly, West Pennsylvania Railways, also dwelt upon the competitive situation. He said that the automobile industry in its diversified use of materials has a strong commercial position. Through its various organizations it has been able to dominate in large measure the terms and conditions of automobile operation, such as the licensing provisions, the size and weight of trucks allowed, immunity from just and reasonable taxation, etc. Pennsylvania now permits the operation of a 13-ton truck on the highways, which is often followed by a trailer nearly as heavy. New York State is more liberal, and of course many of the trucks from that State are going over the Pennsylvania roads. He said he doubted whether there is any road now being constructed that will successfully carry this heavy traffic authorized for the fifteen or twenty years, representing the term of the bonds sold to build the road.

The question of adequate taxation is an important one. An irresponsible person may ask for and be granted a certificate of convenience and all he is required to pay is his license fee and income tax. The incorporated utility, on the other hand, must pay 5 mills on the value of its capital stock, 4 mills on its bonded indebtedness, a varying poll tax, municipal taxes and paving taxes. In connection with interurban bus traffic, a beneficent highway department often clears off the snow for long stretches, adding to the burden of the railway companies by so doing.

Mr. Donnelly said that certainly it is true as never before that the utilities should have a strong organization. They have been long content to take a defensive attitude, but they are now confronted with the organization activities of other industries, whose methods and plans are at variance with the best interests of the electric railways, though meaning to do no more than to get the best they can for themselves. He urged the association to be aggressive to the extent at least of submitting to these other interests some of the railway company problems, and then, in the interest of fair play and the general public good, to seek such compromises as may be possible.

C. L. S. Tingley, American Railways, pointed out that a broader point of view is needed in dealing with the motor bus. It will be impossible to stand in the way of anything which represents real progress. If the bus is economically sound and will provide a cheaper form of transportation than is now available it is going to come in spite of any opposition. The problem of the railways now is to demonstrate that the bus does not provide a cheaper means of transportation than the railways.

He spoke of an $8,000,000 bond issue

Digitized by Google

for roads which had been built and had disappeared long before the bond issue had been retired. This is a common occurrence and it goes to emphasize the justice of the automotive common carriers using the highways bearing a just proportion of the cost of building and maintaining them. That they must do this is inevitable.

Mr. Tingley said that his company had filed application for a certificate to operate a bus line and was negotiating for the purchase of buses, which service would supplement the street car service now being given. He thought that this was a step which should be taken by all railway companies wherever a territory exists which justifies the installation of some service, but where the traffic available is not sufficient to warrant the construction of railways. He thought it to be almost a certainty that the tendency will be for Public Service Commissions to recognize the responsible railway company as against an independent operator when both are making application for the same bus route.

David I. McCahill, president Pittsburgh, Harmony, Butler & New Castle Railway, told the convention that application had been made in his name for a bus and truck line to serve as a feeder to the railway. He considered that this was one of the short cuts in solving the problem of automotive competition.

H. L. Mitchell, vice-president West Penn Railways, told of an instance in 1920 where among forty-eight applicants for certificates to operate bus lines it was found that sixteen were equipped with stolen cars and another man was a criminal that had been traced through several states.

C. B. Fairchild, executive assistant Philadelphia Rapid Transit Company, said that his company has considered the advisability of beginning the operation of buses in certain locations, but had found that it would be necessary to take out a separate charter in order to do this under the laws of Pennsylvania. This necessity was borne out by other members. Mr. Fairchild advocated that the bus situation be treated first by active effort to bring about proper restriction of bus operation and, second, by the railway companies getting into the bus business themselves.

Another delegate took issue with the suggestions made to endeavor to get taxation and regulation placed on the buses, as it was inconsistent with the idea of the railway companies going into the bus business themselves. He advocated that efforts might better be made to get relief for the railway companies from some of their burdens, rather than to bring additional burdens to the other fellow. It was expressed by several that there is a hopeful indication that the State Legislature will take some action at its next session to make the buses carry a fair share of the cost of roads.

John A. Dewhurst, Day & Zimmermann, spoke of the experience of the railway company at Oil City, Pa., in operating a bus line from the end of its railway to a neighboring city, Franklin, over a concrete road. After six or seven months operation, this bus line began to make a small profit, after charging off all operating expenses, interest and depreciation on the basis of a life of 150,000 miles. Including all these things, the total expense has amounted to 23 cents per bus-mile.

Mr. McCahill raised a pertinent question when he propounded to the members whether the railway companies should not seriously consider the establishment of some form of pick-up and delivery service for operation in conjunction with the railway. He cited an instance where in a hearing before a commission a group of shippers had strongly maintained that the trucking company which the railway was opposing should be permitted to continue operation as it provided a pick-up and delivery service which the railway company did not. This case is not yet decided.

Mr. Reily, Chester, Pa., told of an extensive investigation he had made as to the financial showing of bus companies. In general he had found that the results being obtained by many of the independent operators were very satisfactory indeed, some earning as high as $36 a day. Mr. Tingley mentioned a company operating over the Lancaster Pike that earned last year 38 per cent on its investments, and another line out of Philadelphia which made $4,000 surplus in addition to operating expenses and depreciation.

As a part of the afternoon program D. C. Ainey, mechanical engineer, of Harrisburg, Pa., read a paper in which he discussed some of the intangible elements of value in power houses. W. J. Clardy, Westinghouse Electric & Manufacturing Company, read a paper on "Double-Truck Safety Cars," in which he reviewed the features of the double-truck safety car developed by the Chicago Surface Lines, the Syracuse turnstile cars, the Lexington and other light-weight one-man interurban cars, etc. He then made some comment as to the relative merits of these various designs. He said that when comparing the double-truck safety car developed in Chicago with the standard safety car it is evident that the loading and unloading facilities of the former must excel the latter to compensate for the difference in capacity. The use of the separate entrance and exit is an improvement in this respect, but it is difficult to maintain two lines of passengers moving through the car even with the wide aisle.

Referring to the turnstile cars, Mr. Clardy said that the cars in service in Syracuse afford exceptionally good loading and unloading facilities as passengers are entering and leaving at opposite ends of the car. This feature eliminates interference and provides a means of handling traffic with a car operated by one man. The turnstile seems to operate satisfactorily, but the space required for its installation is a disadvantage. This is especially true on a car that is arranged for double-end operation. A recent development which is intended to eliminate this objection is a reversible one-way gate. This gate functions as well as the turnstile and accomplishes the same result with practically no more space requirements than a door. It is installed just within the door and is easily operated.

Continuing, Mr. Clardy said that the light-weight, one-man car for interurban service has proved very successful for certain applications and no doubt there are many places where such a car will meet the requirements satisfactorily. However, care should be taken not to apply a car of this type where it is too light to handle the traffic. Where the time between terminals is relatively short, say not over two hours, where the stops are frequent, that is, 1 or 2 miles apart, and when maximum running speeds of 35 m.p.h. are sufficient to maintain the schedule, a car weighing less than 30,000 lb. can perform the service. For longer runs and faster service heavier equipment is necessary, and in some cases must compete with that of steam roads.

One-man operation of interurban cars does not materially affect the schedule in service where the light cars can be used. Heavy loading is usually at terminals where there is a layover and it causes no delay. The saving due to one-man operation is less for interurban service than for city service, as the crew expense composes a smaller part of the operating costs. Platform labor cost tends to decrease as schedule speeds increase. However, he contended that the maximum saving of crew expense for interurban service will be realized where the traffic is suitable for the light-weight car, as the scheduled speeds are not high in this class of service.

He pointed out further that most of the double-truck safety cars that have been placed in service recently are equipped with four 25-hp. motors and do not weigh over 30,000 lb. when completely equipped. The 25-hp. motors should not be accepted as a universal application for this type of car. There will be instances where the service will require a larger equipment, particularly on interurban lines.

Considerable discussion followed Mr. Clardy's paper. Mr. Reily, Southern Pennsylvania Traction Company, spoke of a line known as the Delaware County Line, on which one-man operation had been substituted without any change in the arrangement or equipment of the cars except to install folding doors, fare boxes and use metal tickets. The line had been running with an operating ratio of about 102 per cent under two-man operation, but under one-man operation was making a little money. Strange to say, the number of accidents on the line had

Digitized by Google

dropped off to almost none with but one man on a car, while with two men, accidents were not uncommon. President Donnelly commented that he had had the same experience as to accidents with one-man versus two-man operation.

W. H. Boyce, general manager Beaver Valley Traction Company, New Brighton, Pa., admonished the members not to order slat seats when buying safety cars. He had found from experience that the people really dislike these, and he considered the additional expense and weight involved in cushion seats to be well placed.

D. A. Tomlinson, Portland Cement Association, read a paper on June 2 on the recent developments in making concrete. This dealt with the technique of preparing materials and making up the aggregate to get the best results.

A very interesting paper by L. H. Palmer on bus operation by the Baltimore company, which was presented June 1, was printed in the June issue of BUS TRANSPORTATION. Besides Mr. Ainey, other speakers at the banquet were Judges Hardges and Wickersham and Mr. McCahill. Mr. McCahill referred to his experience in the last two years with having the employees of his company represented on the board of directors, three directors being elected by the employees. He said that in general the employees have selected good men, and while the Brotherhood of Locomotive Engineers had at first refused to have anything to do with the plan, it had later come in and became enthusiastic about the plan. A unique situation at present, he said, is that one of the directors elected is a member of the wage committee of the trainmen. The great advantage of the arrangement has been the opportunity afforded to "sell" the directors representing the men on any matter which the company had under consideration. These men were then instrumental, and very successful, in putting the idea over with the employees in general. Mr. McCahill made the statement that this state of understanding existing between the company and its employees is of the greatest importance in making the railroad pay. He pointed out that it is not hard for the management to understand the problems of the men and if the management can get the men to understand the problems of the railway there will not be much labor trouble.

NEW OFFICERS OF THE ASSOCIATION

The officers elected to conduct the affairs of the Pennsylvania Association during the ensuing year were:

President, C. B. Fairchild, Jr., executive assistant Philadelphia Rapid Transit Company; vice-president, F. R. Phillips, superintendent of equipment Pittsburgh Railways; secretary and treasurer, Henry M. Stine, Harrisburg.

The members of the executive committee are the officers and C. L. S. Tingley, Gordon Campbell, C. Fred Crane, Thomas Cooper and T. B. Donnelly.

American Association News

Executive Committee in Montreal

IN VIEW of the meeting of the Canadian Association in Quebec on June 1 to 3, the American Association executive committee met in Montreal on May 31. The principal discussion centered on the Chicago convention, particularly with regard to space rented on the pier. A base rate of 75 cents per square foot was finally fixed, although this is less than was estimated to be necessary to cover the cost. The association will pay any deficit that may accrue due to this action.

Among the items of business transacted the following are the most important:

1. Charles L. Henry reported regarding the Bacharach bill situation. He said that general sentiment seemed against the bill, but that a further hearing before the sub-committee of the House judiciary committee would be held on June 8.

2. For the committee on publicity, J. N. Shannahan said that the reaction to the financial statement issued by President Todd was excellent. Arrangements are being made for sub-committees to handle advance publicity for the convention in sections. The publication "Truth" is meeting a real need.

3. A committee on nominations was appointed. The personnel will be announced shortly.

4. A committee on motor vehicle regulatory laws was also appointed. It comprises C. D. Cass, chairman; Paul Shoup, A. W. Brady, C. D. Emmons and David Daly.

5. The report of the committee on exhibits was adopted with some revisions, mainly with respect to fixing the space rate as previously mentioned. The committee recommended as director of exhibits C. W. Kelly, who bears the same relation to the National Railway Appliance Association. He is familiar with the local situation as well as with this line of work generally. He will act as the association's agent, but applications for space and payments will be made directly to the association.

6. Selections of names of members of the convention entertainment committee were made, but cannot be announced until acceptances are in.

6. Reports were received on the membership campaign, for use in which a comprehensive booklet has been prepared; on relations with the National Industrial Conference Board, and on the meeting of the United States Chamber of Commerce. On the last-named subject Mr. Shannahan said that electric railway men do not, as they should, appreciate the importance of the work of the Chamber.

The Montreal meeting was attended by these members: R. I. Todd, J. N. Shannahan, J. W. Welsh, F. E. Webster, C. S. Kimball, L. H. Palmer, W. H. Sawyer, J. G. Barry, L. E. Gould, George H. Tontrup, Thomas Finigan, Charles L. Henry. T. A. Cross represented C. D. Emmons, and Labert St. Clair and H. H. Norris attended by invitation.

Most of the members and guests left by night boat or train for Quebec, where they took an active part in the Canadian Association convention.

Mr. Adams Heads Nominating Committee

PRESIDENT C. G. KIMBALL, of the Engineering Association, has appointed the following as a nominating committee: H. H. Adams, chairman; E. R. Hill, Sidney Withington, M. B. Rosevear and W. F. Graves. This committee will make recommendations, and secure the consent of nominees to serve, on or before July 1.

New York Electric Railway Association

THE fortieth annual meeting of the New York Electric Railway Association will be held at Hotel Champlain, Bluff Point, N. Y., on Saturday, June 24. A technical session will be held in the morning at which there will be the address of the president, reports of various committees, and the following papers for discussion:

"Tax and Paving Requirements Now Imposed on Street Railroads and the Resulting Unfairness and Discrimination," by Alfred T. Davison, general counsel Third Avenue Railway System, New York City.

"Service from the Commission's Point of View," by Gen. Lincoln C. Andrews, chief executive officer Transit Commission, New York City.

"The Personnel Factor in the Electric Railway Industry," by Clinton E. Morgan, general manager Brooklyn (N. Y.) City Railroad.

In the afternoon there will be a sweepstakes handicap golf tournament with a court golf tournament and clock golf. Handicaps for the sweepstakes tournament should be sent promptly to H. B. Weatherwax, Room 22, the D. & H. Building, Albany, N. Y. There will also be a baseball game and a ladies' bridge tournament. Later there will be water sports, consisting of canoe tilting, swimming and diving, for which prizes will be offered. The annual banquet will be held in the evening and will be followed by dancing.

For the convenience of the New York members, the transportation committee has arranged for two or three private sleepers to be attached to train No. 29, leaving Grand Central Terminal, June 23, at 8:00 p.m. (standard time) to go straight through to Bluff Point. Reservations for transportation should be made through C. H. Beck, Room 2101, 165 Broadway, New York, N. Y., and requests for hotel accommodations through James P. Greaves, 243 Fifth Avenue, New York.

Wage Reduction Demanded

President of Cincinnati Street Railway Insists Men Shall Accept Cut in Interest of Economy

Ten per cent reduction in wages and sweeping modification of many rules and working conditions have been demanded by the Cincinnati (Ohio) Traction Company of its 1,800 employees, the change to be effective from July 1.

As a basis for the wage reduction President Schoepf said that the cost of living has gone down and that there has been a reduction of wages in other industries. He said that under a service-at-cost franchise there is an obligation of the company and the men to the public.

The maximum wage now paid motormen and conductors is 50 cents an hour. The company requests the men to accept 45 cents. For the first three months of service they would receive 40 cents and for the next nine months 43 cents an hour. Thereafter the maximum rate would prevail. Other wage provisions in Mr. Schoepf's letter are:

Crews operating sand cars, special cars, sprinkling cars, coal cars and supply cars shall receive the regular rate of wages scale for conductors and motormen, ten hours to constitute a day's work. All platform work in all departments is to be performed by transportation men.

Electric shovel operators shall be paid 47 cents an hour, ten hours to constitute a day's work. The pay of carhouse men, members of the association, except car tenders and watchmen shall be decreased 10 cents from the present rates.

The company reserves the right to determine the number and class of men to be placed at each carhouse and these men shall not be discriminated against because of their being members of the association. In case of vacancies that may arise men are to be promoted from a lower to a higher rate of pay or from a night to a day shift, provided, in the opinion of the company, they are capable of filling the position paying a higher rate or the more desirable position. Ten hours shall constitute a day's work.

All men working day shifts shall complete their day's work by 6 p.m. each day.

Carhouse men shall perform such duties as shall be regularly assigned to them or do such other work as the company may prescribe when necessary to facilitate the work. Car tenders shall be paid at the rate of 29 cents an hour, ten hours to constitute a day's work, and they may be promoted to fill vacancies in carhouses provided in the opinion of the company they are capable of performing the higher class of work.

Watchmen shall be paid at the rate of 27 cents an hour, ten hours to constitute a day's work.

Incline gatemen, members of the association, shall be paid at the rate of 27 cents an hour. Curve cleaners shall be paid 29 cents an hour.

Modifications in the several sections of the agreement are: In section 8 providing that employees may be absent on union or company business without losing rank or position adds that there must be sufficient reason for such absence. There is a curtailment of the time allowed to make out accident reports.

In the section dealing with free transportation to employees in place of a book, it is provided that this transportation shall be in such form and subject to such regulations as may be prescribed by the company.

The use of one-man cars is foreshadowed in the change of the section covering the use of motormen as conductors and conductors as motormen by the addition of these words: "This section shall not apply to men that may be called upon to operate one-man cars should the company begin the operation thereof." There are provisions regarding sprinklers, trippers, the penalty for missing and for meal relief.

In the event the men do not accept the terms proposed President Schoepf suggested arbitration on the entire agreement from section 5 to section 33 inclusive. He said he has been kept from Cincinnati by illness, but on his return he will be pleased to meet representatives of the union.

The reply of the union follows in part:

In presenting this matter you stress the point that there has been a continued reduction in the cost of living since our last agreement was entered into. We cannot agree with you that this continued reduction in the cost of living is an actual fact; on the contrary, living costs according to the statistics of the United States Government have advanced in the last sixty days.

Last year we voluntarily accepted a wage reduction, at least as large as any other class of workmen in Cincinnati has been asked to accept, and we do not believe that you are justified in insisting upon this proposed reduction and these changes in our working conditions at this time.

We realize that the company and its employees jointly have a direct obligation to the people of the community, but we do not believe that the people of Cincinnati desire a lower fare when they know it will mean a lower standard of living for the men.

We regret that illness has prevented you from calling the officers of the association into conference to discuss the conditions of employment and we note your willingness to have such a conference on your return to your office and suggest that as the best course to pursue at this time. If, however, it is found at these conferences that there are questions upon which we cannot agree we will gladly accept your proposal for arbitration.

Brazil Gets $25,000,000 for Electrification Work

For electrifying the suburban division of the Central Railway of Brazil, owned and operated by the Brazilian government, the Republic of Brazil has negotiated in New York a $25,000,000 thirty-year 7 per cent gold bond issue. The Central Railway is the principal railway system of Brazil, operating approximately 1,563 miles of lines serving the important states of Rio de Janeiro, São Paulo and Minas Geraes. The bonds are direct obligations of the government of the United States of Brazil and are specifically secured by a first charge on the gross revenues of the Central Railway of Brazil. The bonds were offered for subscription on June 5 at 96½ and interest to net about 7.30 per cent by a syndicate of investment bankers and bond houses headed by Dillon, Read & Company, New York.

Findlay Decision Explained

Service-at-Cost Franchise Case to Be Appealed to Ohio Supreme Court for Settlement

It now appears that the action of the Third Ohio District Court of Appeals on May 22 in declaring illegal the year-old service-at-cost franchise of the Toledo, Bowling Green & Southern Traction Company, Findlay, Ohio, was done for no other reason than to force the issue to the Ohio Supreme Court for a decision.

The litigation started at Findlay in 1921 when an attorney named George Phelps filed suit to test the validity of the company's franchise of 1915 after it had been modified by the City Council. The Common Pleas Court ruled against Attorney Phelps, but he appealed the case to the Court of Appeals. The Court of Appeals reversed the decision of the lower court.

Between the years 1915 and 1921 the company operated in Findlay under a franchise granted early in 1915. The terms of this franchise were of such a nature that with the increasing cost of labor and material during that period the Findlay end of the operation was losing $30,000 a year.

At the close of 1920 the traction company applied to the Ohio State Public Utilities Commission for permission to abandon the Findlay operation. Legal representatives of the city, together with representatives of the Chamber of Commerce, were present at a hearing on the matter before the commission and made their appeal for the retention of the service so strong that the commission suggested the representatives of the various bodies confer with officials of the company with the view to helping relieve them of their burden. As a result the City Council of Findlay modified the 1915 franchise so as to enable the company to operate without a loss.

The modified franchise required the Mayor to recommend to the City Council six reputable citizens, three to be chosen to serve as a rate-making body. This was done and the result was that the fare was increased from 5 to 8 cents. The revenue from this charge was not enough to meet the operating expenses of the company and after three months time the fare was increased from 8 to 10 cents with seven tickets for 50 cents.

The 10-cent railway fare was in effect only a few weeks when Attorney Phelps filed his suit. It may be interesting to know that the Court of Appeals in handing down its decision in the matter was divided. Judge Philip Crow filed a dissenting opinion in the case.

Accept Cut of Five Cents an Hour

The strike on the lines of the Maumee Valley Railway & Light Company, Toledo, Ohio, which became effective on June 1, was terminated on June 3, when the employees accepted a wage cut of 5 cents an hour. The men had been receiving 50 cents an hour for a nine-hour day, time and a half for overtime and a vacation without loss of pay. The company offered 45 cents an hour, straight time for overtime and abolition of vacations. The workers refused the pay cut and as a result interurban service stopped.

New Wage Scale in Effect

A reduction in wages effective June 1 for street car platform men has been made by the Pennsylvania-Ohio Electric Company and the Youngstown Municipal Railway, associate companies. The new scale of wages is 43 cents an hour for men in the service for less than three months, 46 cents an hour for men in the service more than three months but less than one year, 52 cents an hour for men in the service more than one year, 5 cents an hour additional for operators of one-man cars.

The scale which expired on May 31 was as follows: 48 cents an hour for men in the service less than three months, 51 cents an hour for men in the service more than three months and less than one year, 56 cents an hour for men in the service more than one year, 5 cents an hour additional for operators of one-man cars. The only change in working conditions is the removal of a restriction on one-man operation in Youngstown. This means that both companies hereafter may use one-man safety cars on all lines without restriction. The old agreement expired May 31, but negotiations were continued till the agreement was reached on June 5.

Public Opinion Expressed on Burdensome Paving

The committee of civic associations of Indianapolis, Ind., in a report recently submitted to the Mayor expressed itself in favor of relieving the street railway companies from paving requirements. The extract says that this practice of requiring the Indianapolis Street Railway to pay for paving over and along its right of way is one of the inheritances of the old mule car days, when the animals wore paths in the streets, and should have been discarded years ago. The committee emphasizes the injustice of this practice from the point of view of the car rider, who ultimately must pay. In part the report follows:

> The records show that $435,416 has been invested in new paving during the past twelve years, or an average of $36,395 per year. There appears to the committee no justice or equity in this practice. During the last two years the following sums were expended for maintenance: 1920, $111,724; 1921, 117,775, or a total of $229,499. The average for the two years was $114,750.
>
> If this item is eliminated from the operating expense accounts, the net revenue will be increased by a like amount. However, we are of the persuasion that after a reasonable period in which the company may be thus relieved that the Board of Public Works of the city of Indianapolis should be authorized and empowered to order the company to expend a like sum for extensions and improvements.

National Transportation Institute to Be Organized

To Help Co-ordinate the Activities of the Various Methods of Transportation and Disseminate Education on Transportation Principles

Organization in the near future of a National Transportation Institute is practically assured. While no date has been set for the organization meeting, it will be held before the end of the summer. Bird M. Robinson, the president of the American Short Line Railroad Association, and his associates, who are doing the active work of promotion, are engaged at present in lining up such support as will insure the new organization of representative backing. The organization of such a national association is being recommended by Representative Sidney Anderson and his associates on the joint commission of agricultural inquiry set up by Congress. Mr. Anderson, chairman of the commission, in discussing this recommendation said:

> There are approximately $50,000,000,000 invested in transportation in this country, including steam railways, electric railways, highways, automobiles, motor trucks, waterways and shipping. These agencies of transportation, which should function as a co-ordinated system in the aid of commerce, have come into existence without relationship to transportation facilities already existing. There is no agency through which the basis of fact and principle necessary for the co-ordination of these transportation facilities so as to give the most efficient service at the lowest cost, can be secured. There is no place today where the business of transportation can be learned except in the apprenticeship of the business itself. An institution such as the Commission suggests would furnish a means of definitely establishing the facts and principles of transportation upon which sound decisions respecting transportation policies can be predicated; the relationship of the different agencies of transportation to each other, and the relationship of these agencies to agriculture, industry, trade and commerce. It would also furnish a means for the dissemination of education in the principles, operation and practices incident to transportation.

Formal action indorsing the Institute already has been taken by the following organizations: American Farm Bureau Federation, National Agricultural Conference, American Lumber Congress, National Association of Manufacturers, Joint Commission on Agricultural Inquiry, and the American Short Line Railroad Association.

The Institute is to have its headquarters in Washington "under the supervision and control of men of preeminent ability, standing and learning, with reference to transportation," and will attempt to acquaint the public with:

1. The true fundamental principles underlying the various kinds of transportation facilities.
2. The facts as to the present conditions affecting transportation and the relative necessity and importance of each class of common carrier.
3. The real effect of each type of legislation and regulation.
4. How and to what extent, the public and the carriers will be benefitted, or affected adversely, by any policy or course of action that may be adopted in respect to their transportation problems?

Vote on Subway in Chicago Probable Next Fall

Voters of Chicago may have a chance to decide next November whether a subway system is to be built. The local transportation committee of the City Council on June 1 favored a referendum on the question after hearing from a committee of lawyers and engineers. Two propositions are to be considered, both contemplating subways in the central district only. The main dispute is whether the east and west subways should be made to connect with the river tunnels now used by the surface lines. This would save considerable money, but some of the Aldermen fear that this would complicate the city's position and possibly extend the franchise term of the surface line companies.

Civic organizations throughout the city have been agitating the subway question and there is considerable division of opinion, many being opposed to the expenditure of money from the traction fund for a downtown subway. The All-Chicago Council, representing ninety civic bodies, recently expressed disapproval of a municipally owned subway and objected to the use of the traction fund which has been contributed by the surface companies. It is expected that many of the Aldermen and delegates from civic organizations will take a trip through the East early in July to study subways.

Union Heads Liable for Strike Damage

Labor organizations are not exempt from prosecution under the Sherman anti-trust law. This, in effect, is the ruling the Supreme Court announced on June 5.

The court delivered such an opinion in the celebrated Coronado coal case. This is regarded as one of the most important pieces of labor litigation ever to come before the nation's highest tribunal. Chief Justice Taft delivered the opinion.

The court held that labor organizations can be held liable for property and other damages caused by the acts of members during strikes. The case was brought by the United Mine Workers of America against the Coronado and other coal companies, arising out of the Arkansas strikes of 1914.

Chief Justice Taft discussed at length the question of the liability of the national and international unions if the unions were responsible for what was done, pointing out that in common law unincorporated organizations could be sued as individuals, but from necessity of existing conditions it was utterly impossible of doing justice otherwise than by holding labor unions liable.

With regard to the United Mine Workers of America, the court found that the international organization and its officers did not order the strike or ratify it, and that they should not have been made parties to the suit.

Reorganization Plan Out

New Operating and Holding Companies Provided in Reorganization of Cleveland-Southwestern Line

A plan for reorganizing the Cleveland, Southwestern & Columbus Railway operating hundreds of miles of interurban trackage in Ohio, has just been sent to bondholders by Hayden, Miller & Company, Cleveland investment brokers. This company was forced into a receivership on Jan. 20 of this year. Since that time the road has been operated by F. H. Wilson, its president, as the receiver.

The plan for reorganizing the company provides for the formation of a new operating company to be known as the Cleveland, Southwestern Railway & Light Company, and also a holding company to be known as the Cleveland & Southwestern Company. This holding company would own and hold the entire common capital stock of the new operating company. Securities of the holding company will consist of, first, approximately $4,000,000 in 5 per cent cumulative preferred stock to replace the Cleveland, Southwestern & Columbus Railway Company's bonds for 1907, second, common stock no par value shares, the majority of which will be pro-rated and distributed to present preferred stockholders.

SUMMARY OF NEW SECURITIES

New securities as proposed to be issued will include:

1. An authorized issue of $1,500,000 in twenty-five-year sinking fund prior lien bonds bearing not more than 6½ per cent interest, $1,000,000 of the bonds to be issued at once to obtain funds to provide for essential improvements and as working capital, $500,000 to be held by the Union Trust Company as trustee for the purpose of providing sufficient funds to give the railway an approach and a connection with the proposed new Cleveland Union Station.
2. $1,500,000 in thirty-year 6 per cent extended bonds of four existing issues, these bonds being extended to 1952.
3. $3,700,000 authorized thirty-year first consolidated mortgage bonds of the Cleveland & Southwestern Railway Light Company to be used in replacing bonds held by the old company, adjusting accrued interest on other bonds and for the exchange of old bonds.

In their letter to the stockholders, Hayden, Miller & Company point out that when the old Cleveland, Southwestern & Columbus Railway was built in the early days of electric interurban railway service, its future seemed assured but that rapid development of Cleveland roads and the automobile have been prime factors in curtailing earnings. The result of this has been that for the last ten or fifteen years net earnings have not been sufficient to maintain the property adequately.

The statement of Hayden, Miller & Company shows surplus earnings of $15,129 and $90,217 in 1920 and 1919, and deficits of $64,818 in 1917; $57,569 in 1918 and $99,163 in 1921. The report further adds that because no depreciation has been charged off except on car equipment, additional depreciation charges of at least $50,000 a year should be made; that to avoid a complete breakdown, $600,000 should be expended at once on new power equipment and new rolling stock.

The formulators of the reorganization plan say that the improvements contemplated would save $100,000 a year in operating expenses, but that even then the company's earning capacity does not justify a funded debt of more than $5,000,000, although present bond issues aggregate $7,100,000. They add that the proposed plan will decrease operating expenses $100,000 a year, increase net revenues, cut annual fixed charges about $100,000, reduce the funded debt from $7,100,000 to about $4,700,000 and preserve the system as an operating entity.

Railway Issues Included in Bonds Called In

According to financial experts, easier money conditions are seen in the amount of bonds calling for payment in June of this year in advance of maturity. Among the important issues called during this month are 7½ per cent notes of the United Railways & Electric Company, Baltimore, Md. The company was expected to pay at 105 on June 1 $1,500,000 due January 1, 1930. The Detroit United Railway's $2,000,000 due 1923 was to have been paid on June 1 at 100½. Owing to the purchase of these lines by the city the company is able to pay off these bonds before maturity. Other railway issues calling for payment in advance of maturity dates are the Manchester Traction, Light & Power Company's 6's and the Ashland Light, Power & Street Railway Company's 7's.

Payment of Back Dividends Being Arranged

The West Penn Traction & Water Power Company, Pittsburgh, Pa., has declared the regular quarterly dividend of 1½ per cent on the preferred stock, payable on Aug. 15 to stock of record Aug. 1; also a dividend of 10¼ per cent to apply on accumulated preferred dividends, payable on Aug. 15 to stock of record Aug. 1. This dividend will be paid 1¼ per cent in cash and balance in 6 per cent interest bearing dividend warrants, in three installments, on Feb. 15, 1923, Aug. 15, 1923, and Feb. 15, 1924.

At a meeting of the directors it was voted to recommend to the stockholders that the company's name be changed to West Penn Company, final action to be taken at a stockholders' meeting on June 21. The company is a subsidiary of American Water Works & Electric Company, which holds 48 per cent of the preferred stock to which accumulated dividends apply.

Key Plan Modified

More than 80 per Cent of Bondholders Have Agreed to Reorganization—Slight Modification Proposed

After hearing the reports of subcommittees representing the various groups of security holders, the reorganization committee of the San Francisco-Oakland Terminal Railways, Oakland, Cal., has decided to modify some parts of the reorganization plan dated July 20, 1921. The plan as modified will be offered to the security holders and, if acceptable to them, will become operative at the expiration of thirty days after notice of modification under the terms of the original plan.

The following modifications have been adopted by the committee:

1. It was unanimously decided to eliminate the tidelands from the reorganization plan which originally contemplated retention of ownership of the tidelands by the new operating company.

2. The Halsey notes will be refunded by a subsidiary of the new operating company for the present principal of $2,500,000 in accordance with the conditions set forth in the original plan, except that the new issue will have a maturity of ten years instead of fifteen years and except for the elimination of a second lien on the tidelands from the security back of the Halsey obligation.

3. It was unanimously decided to modify the plan so that instead of one share of new common stock for two shares of old preferred stock, as provided originally, one share of new common stock will be issued for four shares of old preferred stock.

4. It is proposed to include in the plan a voting trust on such a basis as will legally place the voting power in the hands of a trustee of the stock (the stockholders themselves receiving trustee's certificates instead of actual stock) for seven years, with a board of directors of fifteen persons selected by the three several groups of security holders as follows:

(a) As representing the general mortgage bonds of the new company, four directors and the following are those selected for the first year: W. W. Garthwaite, C. O. G. Miller, P. E. Bowles and John S. Drum.

(b) As representing the "A" and "B" preferred stock of the new company, eight directors and the following are those selected for the first year: Warren Olney Jr., J. K. Moffitt, Robert G. Hooker, Samuel Knight, H. C. Capwell, B. H. Dibblee, Miles Standish and A. Crawford Greene.

(c) As representing the common stock or equity in the company, three directors and the following are those selected for the first year: W. I. Brobeck, W. R. Alberger and J. F. Carlston.

Inasmuch as $13,486,000 of the total outstanding issue of $16,401,000 bonds, or 82.22 per cent, have been deposited, it is believed that much more than a majority will agree to the present modifications. The security holders have thirty days within which to designate their approval.

Interborough Hearing Concluded

Public hearings have been concluded before the New York Transit Commission on valuation of Interborough Rapid Transit property, made for the purpose of acquisition by the city for proposed plan of city-wide transit unification.

C. W. Kellogg, of Stone & Webster, defended the Interborough valuation estimates, despite attacks on their reliability by counsel of commission. He did admit, however, that Stone & Webster had made no original investigation as to material prices used in the estimate. The witness said also that determination of overhead by applying 22.2 per cent arbitrarily to total expenditures of $99,000,000 under subway contracts Nos. 1 and 2 was not sound engineering practice. According to Judge Shearn, counsel to commission, approximately $21,000,000 was improperly added to cost by this method.

Mr. Kellogg stated that errors in cost of steel and labor in company estimates did not affect totals sufficiently to warrant rejection. In regard to the opinion expressed in Interborough estimates, and approved by Stone & Webster, that commodity prices would in general be maintained, witness asserted that he was not in agreement with recent statement made by Coverdale & Kolptiz, engineers engaged in appraising Manhattan Railway property, that general trend of prices would be downward.

$103,594,395 Value Claimed

The Manhattan Railway, New York, N. Y., places the value of its property at $103,594,395, the New York Transit Commission was told at first hearing on elevated railroad valuation. This figure compares with $55,417,949 recommended by the commission's bureau of valuation, for the purpose of acquiring property in the name of the city, for inclusion in the commission's transit plan.

The basis of the company estimates is the cost to reproduce property today, while the value recommended by the commission is based on original cost less amount necessary to place the property in first-class operating condition. Only property useful for operation is considered in the commission's report and no account is taken of franchise or going value. The commission's estimate for cost to reproduce at 1921 price is $97,309,796, which includes an item of $9,913,422 for general expense.

The Manhattan value of $103,594,395 represents present estimated value of $81,504,534, plus $22,089,861 for general expense of administration, organization, engineering, etc. The company carries property on its books at $113,001,414, and has outstanding capital stock and bonds to the amount of $105,199,439.

The Transit Commission on June 6 continued its hearings on its valuation of the property of the Manhattan Railway. It was asserted that the Manhattan elevated system, leased by the Interborough Rapid Transit Company, would pay larger dividends if not burdened by the Interborough extensions.

George W. Burpee, expert for the Manhattan Railway, testified that 3.4 to 4 per cent could be earned by the company on the common stock for the fiscal year ending June 30, 1922, with the range increasing to from 7.1 to 8 8 per cent for 1926. These data were submitted in line with the Manhattan company's claim that its lines today, independent of the outlying extensions built by the Interborough Rapid Transit, and merged with the original system are worth more than $100,000,000.

$3,000,000 Milwaukee Issue Offered

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., placed on sale on June 1 its new issue of $3,000,000 of 7 per cent cumulative preferred stock. The issue is being offered locally to Milwaukee and Wisconsin investors at par for cash or on the partial payment plan. The plan to offer this issue has been referred to previously in the ELECTRIC RAILWAY JOURNAL.

Cleveland Stock Selling at Par

For the first time since Jan. 2, 1920, stock of the Cleveland (Ohio) Railway went to par on June 2, 1922, one hundred shares changing hands at this figure. The stock has jumped fourteen points since the first of the year. It yields a 6 per cent return.

With the stock now selling at par, the company very likely will soon attempt to market new securities for the purpose of making betterments and extensions and adding to its rolling stock. No new stock has been sold for more than two years because a provision in the service-at-cost ordinance forbids the sale of new stock at a price under par.

Plan to Liquidate Deferred Dividends

Directors of the Appalachian Power Company, Princeton, W. Va., have submitted to their stockholders a plan to be acted upon at a special meeting, to be held on June 15, whereby the accumulated dividends on the preferred stock will be paid off, and the present preferred changed for a new senior issue on which the regular quarterly dividends of ¾ per cent are expected to begin in January of next year. The amount of accumulation at present is $70 a share.

The plan also provides for the issuance of 40,000 shares of preferred stock $100 par value, cumulative at 7 per cent after Oct. 1, 1922, of which 37,060 shares are to be exchanged for 21,800 shares of the present preferred with $70 accumulated dividends thereon, the exchange to be made at the rate of $1\frac{7}{10}$ shares of new stock for each share of the old with its accrued dividends.

In addition to initiating dividends on the preferred in January, 1923, the management expects to be able to show a substantial surplus for the common.

Included in the system of the company are 21.5 miles of electric railway.

Sanderson & Porter Will Direct New Brunswick Power Affairs

Sanderson & Porter, New York, N. Y., have taken over the direction of the affairs of the New Brunswick Power Company, St. John, N. B., from P. W. Thomson and his associates. M. A. Peeler has been appointed general manager of the company. He has recently been assistant general manager of the Potomac Public Service Corporation, Hagerstown, Md., formerly the Hagerstown & Frederick Railway.

There has been considerable speculation locally in St. John on the effect the change in management will have on the strike of employees of the company in operation for a year. As indicated in the ELECTRIC RAILWAY JOURNAL for June 3, the strike of the employees as a strike has long been over, but the baneful effect of the labor trouble still lingers.

Preceding Mr. Thomson as manager at St. John was T. H. McAuley, Calgary, Alberta, formerly manager of the Calgary Street Railway. Preceding Mr. McAuley was H. M. Hopper, formerly secretary-treasurer of the old St. John Street Railway, and now in the electrical supply business in St. John. Before that W. Z. Earle, C. E., was general manager for a short period.

The president of the New Brunswick Power Company is L. R. Ross, terminal agent of the Canadian National Railways at St. John. The company is owned by American and Canadian capitalists. Most of the bondholders are represented by banking concerns in New York, Boston and Providence. A representative from Providence has been in St. John for some time looking after the interests of the American security holders. There is only one general issue of bonds outstanding against the properties of the companies. The interest on this issue has always been met regularly.

There are two issues of preferred stock outstanding in addition to the common stock, and while on two occasions the dividends on these issues have been deferred, payment is understood to be behind on only one of these for a single period, and this is said to be a technical default rather than an actual default of payment.

The railway at St. John consists of twenty-five miles of track.

Increase in Capital Stock Proposed

The Honolulu Rapid Transit Company will increase its capital stock from $2,000,000 to $3,000,000, as was recently authorized by the stockholders' meeting, subject to the approval of the Public Utilities Commission of Hawaii. The additional stock will be held in the treasury and sold as occasion demands, for capital improvements. With the approval of the commission it is proposed to issue immediately $500,000 worth of stock to provide money for betterments, extensions and rerouting on several lines. The new stock will have a par value of $20 and has been placed on the local exchange.

Traffic and Transportation

Jitneys Must Go

Detroit Rules Autos Off Main Traffic Thoroughfares—Oct. 1 Last Day for Pirates

All jitney licenses under the former ordinance in the city of Detroit expired on May 15. A new ordinance has been passed by the City Council. This measure increases the amount of the bond for drivers, requires a separate bond in each instance and eliminates jitney traffic entirely from Fort and John R. Streets, Michigan, Grand River, Woodward, Gratiot, Cass and Jefferson Avenues and the parks and boulevards.

In connection with a recent study of traffic congestion in the city of Detroit the Department of Police reported the number of street car passengers, automobile passengers, passengers in horse-drawn vehicles and pedestrians passing various important street intersections. In explaining that a partial solution of the difficulty due to accidents caused by automobiles could be overcome by more stringent regulations of jitneys, it is cited by Police Commissioner James W. Inches that with the return to normal industrial conditions the amount of traffic will be greatly increased and the problem of its regulation will become much greater.

Since the adoption of the jitney ordinance on June 9, 1921, approximately 2,300 jitneys have been licensed to operate in the city. In April about 1,674 jitneys were active. They ran for the most part upon Woodward Avenue, Jefferson Avenue, Grand River Avenue, Michigan Avenue and Fort Street, thoroughfares which radiate from the business center of the city, all of which are heavily congested.

While the ordinance was to take immediate effect on May 15, when all jitney licenses expired, officials of the jitney organization succeeded in having the enforcement of the ordinance postponed until Oct. 1, in order that some of the drivers who have purchased their cars on time may still operate. Licenses will not be renewed for next year, but the temporary licenses will permit drivers whose records are clear and who are dependent on the jitney business for a livilihood to run until Oct. 1.

Officials of the Detroit Department of Street Railways consider that the jitney as a factor in Detroit's transportation system is ended and that the people will go back to riding on the street cars and motor buses as there are now probably less than 500 jitneys operating in the city and some of the streets have already been cleared of the pirates.

It was reported that the jitneys collected fares that would have netted the Detroit United Railway $12,000 a day, prior to the taking over of the D. U. R. city system by the city street railway department.

While increased employment in local factories caused many operators to quit prior to the passing of the new ordinance, the Council's action is considered as sounding the end of the business.

Woodward Avenue, according to records in the police department, had the largest number of jitneys, 502 being operated over that avenue when the business was at its height.

There had already been four amendments to the original ordinance, but in view of the several additional amendments considered necessary by the police department, the new ordinance was prepared by the Corporation Counsel's office and approved by the Mayor.

Seven-Cent Fare in Chicago

Court Has Fixed New Rate—Probable Income Decrease $8,000,000—Company Insists Wages Be Reduced 20 Per Cent

THE rate of fare on the Chicago Surface Lines will be reduced from 8 to 7 cents on June 15. Tickets will be sold at the rate of three for 20 cents and children under twelve years may ride for three cents. These were the terms fixed by the United States District Court on June 1 as conditions under which a temporary injunction would be granted against the 6-cent fare order issued by the Illinois Commerce Commission on April 8.

Inasmuch as this cut in the rate of fare is expected to reduce the company's income about $8,000,000 annually, prompt steps were taken by the management to reduce expenses. President Henry A. Blair immediately served notice on the employees' organization that the company was ready to start at once on conferences with a view to changing the contract by which the men have been receiving a maximum rate of 80 cents an hour since June 1, 1920. This agreement calls for thirty days notice so that the new scale will become effective on July 2. Representatives of the employees talked strike as soon as rumors of a possible reduction in wages were circulated, but it is expected that arbitration will follow if an agreement cannot be reached by conference. The new rate of pay which has been suggested is 64 cents an hour, a 20 per cent reduction.

The decree of the Federal court was unusually brief. The case had been heard by Judges Evans, Page and Geiger, who entered a temporary restraining order some time ago to prevent the commission order from going into effect while the case was being considered. Judge Geiger did not agree with his associates. The order follows:

> Upon consideration of the issues presented in this cause, Judge Evans and Page are of the opinion that a temporary injunction should be granted as prayed for, but upon the terms and conditions following: That plaintiffs, beginning not later than June 15, 1922, shall charge not to exceed the following rates: For a continuous trip in one direction within the present limits of the city of Chicago over the street railway operated by the companies and on extensions thereof, whether owned, leased or operated by them, the sum of 7 cents for each passenger twelve years of age or over, and 3 cents for each passenger under twelve years of age; provided that the children under seven years of age, accompanied by a person paying fare, shall be permitted to ride free, and upon the further condition that for adult passengers three tickets shall be sold for 20 cents upon all cars. Transfers shall be issued good as heretofore. Judge Geiger is of the opinion that the application for an injunction should be denied. An order may be entered directing the issuance of an injunction as above specified.

One important question was left undecided. Under a former order of the Federal court, entered last November, transfers have been issued as rebate slips. It was contended when the original 5-cent fare order was issued by the commission that these slips might have a value of 3 cents each. When that order was annulled and a 6-cent order entered April 8 it was stated that the slips might be worth 2 cents each. Another theory is that those issued since May 1, when the 6-cent order was to have become effective, might be worth the difference between 7 and 8 cents. This point probably will be taken up by the city's lawyers for interpretation. It is not known how many transfers issued since the original order of the court have been saved by passengers.

Attorneys for both sides asserted that the Federal court had no power to fix rates, but they agreed that the court could prescribe conditions upon which an injunction would be granted. It is conceded that the companies have only the other alternative of submitting to the 6-cent order.

The 8-cent fare has been effective on the surface lines since July 1, 1920, previous experiments having been made with a 5, 6 and 7-cent rate. When the old commission went out of existence the city of Chicago took prompt steps to regain the 5-cent fare, and after a long hearing such an order was issued by the new commission last November. This was enjoined by three judges of the Federal court as being confiscatory. A similar showing was made as to the 6-cent rate, and the present order was the result.

Following the entry of the order, officials of the employees' union issued a statement in which they said:

> The city of Chicago has extracted from the railway approximately $40,000,000 since 1908 in what is known as the 55 per cent—also payment for power for operating bridges, cleaning, sweeping and repairing

Digitized by Google

streets, that the street car men have been compelled to collect from the traveling public, the same being turned over to the city by the company, and we are satisfied that this great sum of money, which has been collected from the public, has been put to very little benefit to the public, if any. The company has also lent great sums over and above the operating expenses, and we believe the employees of the surface lines have earned large profit for the city of Chicago and the railway. Under these conditions we feel it is unjust to ask the men to take a reduction in wages at this time, when rents and taxes have increased to a point where they offset any reduction in other costs of living.

Literature and Exhibitions to Promote Safety

A series of short articles on various pertinent safety topics written by H. O. Allison, safety engineer of the Beaver Valley Traction Company, New Brighton, Pa., and first published as a daily first page feature by the Beaver Falls *Tribune*, has been published in a booklet for further use of the company in promoting safety work. This brings together in convenient form a booklet which is being used effectively in promoting safety work among the school children particularly, and among the citizens along the line of the Beaver Valley Traction Company in general. It undoubtedly would afford a number of suggestions for other railway companies in pursuing their safety work. A complimentary copy may be obtained from the company.

A mammoth rally and exhibition in the interests of "safety first" was recently given at Junction Park by the safety committee of the Beaver Valley Traction Company. The demonstration was attended by thousands of people and contained some attractive accident posters made by the school children of the county. Safety addresses were delivered by Judge Frank E. Reader and A. W. Robertson, president of the western Pennsylvania division of the National Safety Council. On the day of the rally a specially painted yellow car attracted considerable attention with its safety slogans, such as "Life Is Sweet—An Accident May Deprive You of It" and "Knowledge Plus Caution Equals Safety."

Interurban Fares Fixed by Court

Enforcement of traction company rates that provide no return on property investment is confiscatory and an invasion of constitutional rights, the United States Circuit Court of Appeals ruled on June 6. The decision granted the Augusta & Aiken Railway & Electric Corporation, operating in South Carolina and Georgia, the right to increase its rates over those fixed by the Railroad Commission of South Carolina.

The line between Augusta and Aiken is divided into eight zones, on which the fare prescribed was 5 cents for each zone or 40 cents between the cities. Under the ruling of the court just rendered the company is permitted to charge 8 cents a zone or 64 cents for the full trip, an increase of 24 cents over the old rate.

Variable Ticket Rate Suggested for Louisville

Conditions on which the Louisville (Ky.) Railway will consider a compromise with city officials on the 7-cent fare controversy have been announced by James P. Barnes, president.

The conditions named by President Barnes propose a continuation of the 7-cent cash fare, with 6¼ cents ticket fare. He would have the fares adjusted each six months or a year, based on the operation expense, so that investors will net a fair return on their money.

The company would be willing and ready to start the new fare schedule within a few months, Mr. Barnes said, adding that some very badly needed repairs must first be completed. Cash fares would continue at 7 cents, and tickets would be sold either four for a quarter or eight for half a dollar.

Improvements held necessary by President Barnes include the purchase of from seventy-five to one hundred new cars and the installation of new generating equipment at the company's High Street station in place of obsolete equipment in use at Campbell Street station.

Since the company won out before the United States Circuit Court of Appeals there has been talk of a compromise between the company and the city. Mr. Barnes and other company officials have conferred with Mayor Quin and Clayton B. Blakey, city attorney, regarding the next step to be taken to bring about a settlement of the controversy. The outstanding question to be decided if the negotiations are continued will be the amount to be allowed as a valuation figure on which to base the fare rate.

Plans for Altering Traffic Rules in Los Angeles

The Los Angeles Traffic Commission, which has for several months been conducting an investigation of traffic congestion in the downtown section of the city, has prepared a list of suggestions intended to improve conditions, continue parking downtown and also provide facilities for the delivery of merchandise to business houses. The last feature has been a most perplexing one, as trucks often are forced to park in the second line of traffic in order to deliver merchandise to downtown stores.

The executive committee of the commission, of which H. Z. Osborne, Jr., chief engineer of the Los Angeles Board of Public Utilities, is chairman, has adopted the following recommendations which will be forwarded to the City Council for consideration:

1. That during a given period of one or more hours in the early morning before the 45-minute parking law applies, no parking be permitted downtown except for loading and unloading purposes. This is expected to give room at the curb for delivery wagons.
2. That if the Council desires curb spaces be established in each block for the sole purpose of permitting vehicles to draw up there for two-minute periods for loading and unloading purposes.
3. That left-hand turns of vehicles be prohibited in the congested district of the city and left-hand turns of street cars be reduced to a minimum.
4. That no vehicles be permitted to turn in the middle of the block in the congested district.
5. That no vehicle be permitted to stop on street car tracks between street intersections for any purpose whatsoever.
6. That traffic officers at intersections give the right of way to a street car which is ready to move, except where automatic signals are in operation, in preference to vehicular traffic, because the street car handles from ten to twenty times as many persons as an automobile and because it cannot route itself to avoid congestion, as can other vehicles.
7. That no taxicabs, rent cars or sightseeing buses be permitted to stand on the street in the congested area while awaiting employment. This is the present regulation but it is not being rigidly enforced.

New Prepayment Station in Boston

Owing to the congestion in the Boston street car subway, particularly at the Park Street station, the Boston Elevated Railway is planning to add a new rapid transit route, one terminal to be at the corner of Harvard Avenue and Commonwealth Avenue, the other to be at Lechmere Square in East Cambridge. Trains will be run through the existing subway over this route every four minutes during normal hours and every two minutes during the rush period.

A terminal prepayment area will be located near Harvard Avenue, Allston, between Commonwealth Avenue and Brighton Avenue, at which passengers arriving on surface cars from Watertown, Lake Street and other points west can transfer to the rapid transit service. The company considers that developments of the train service between definite terminals and the interchange of passengers between surface lines and these rapid transit lines have been the basis upon which Boston's system must develop, and this new routing is just the extension of this idea.

Mandamus Proceedings in Progress

Set for June 1 and postponed one day, the mandamus proceedings brought by the city of Minneapolis to compel the Twin City Rapid Transit Company to produce for examination by the city attorney, Neil M. Cronin, and the valuation expert, Delos F. Wilcox, certain account books which it had not produced when acting upon an order by Judge H. F. Dickinson of the District Court partially, are under way before Judge W. C. Leary of the same court. The city claimed that the company had not yet produced data prior to 1900, notwithstanding the order. It is desired to enforce as a question of law a claim that the company owns and operates the Minneapolis Street Railway as part of its preparation of a case before the State Railroad and Warehouse Commission, opposing any further advance in the rate of fare from 6 cents and instead suggesting a lower rate than 6 cents. The company alleged it is ready to produce these books. The city threatened contempt proceedings against every officer of the company as a move to get further access to the books.

The hearing was continued on June 5.

Personal Mention

John Kerwin—Track Expert!

Official of Detroit United Railway, Noted for Inventions, Is Leaving Railway Field

With the passing of the Detroit United Railway from the streets of Detroit, John Kerwin, superintendent of tracks for that company, has decided to terminate a service of thirty years and retire to private life, devoting his time to his real estate holdings in Detroit.

Mr. Kerwin joined the ranks of Detroit's street railways in 1892. Starting at the lowest rank of street railway work, by sheer ability and personal genius he advanced himself through every phase of the work, on the street, in the shops and in the executive offices.

In 1893 he went to work for the old

JOHN KERWIN

Detroit City Railway, shoeing horses. It was still the day of the horse cars, but a new era had dawned. In 1894 and 1895 some of the old street railways were consolidated under Tom Johnson into the Detroit Citizens' Street Railway and Mr. Kerwin was placed in charge of the shops. These years saw the complete change from the horse cars to the electric cars. Mr. Kerwin, in his small shop and with crude equipment, designed and built much of the special trackwork pieces adapted to the need of the electric cars.

On Dec. 31, 1900, the Detroit United Railway was formed, consolidating all the street railways in Detroit. Early in 1901 Mr. Kerwin was appointed superintendent of tracks, which position he held up to the time of his recent resignation.

During his service Mr. Kerwin has built or rebuilt every foot of street railway track in Detroit. He not only saw the railway grow from a comparatively small mileage to one of the largest systems in the country, but it was his inventive genius which aided largely in the accomplishment. He created and originated many nationally used devices and much labor-saving machinery, such as the Kerwin portable crossover and the Kerwin rail grinder. Among his latest labor-saving machines is a concrete mixer with a capacity of 600 cu.yd. of concrete in ten hours, which handles all its materials unaided from the cars into the finished product.

Mr. Kerwin has also recently invented and patented a steel railway tie which has been under test for two years in paved track construction on the Detroit United Railway interurban lines and has proved successful.

For years Mr. Kerwin has been recognized by engineers generally as a leader in the art. Many street railways have copied his standard construction of paved track. He has probably been as widely consulted in developments and disputes on track construction work as any other engineer in the field.

G. W. Wagner Leaves D. U. R.

"Hang up your hat, wash your face and go to work." Twenty years ago these words were addressed by A. H. Stanley, then superintendent of the Detroit United Railway, to a boy in knee pants who applied to the company for a job. To be exact, it was in 1901. The superintendent of the railway is now a lord and helped England win the war. The boy has grown, too. No nation has yet officially recognized his services as in the case of Mr. Stanley, but "Gus" Wagner, who is leaving his railway work in Detroit, is a very young man yet. There is still plenty of time.

Romance just rages around Mr. Wagner. He is a page of the Henty books reduced to life. As a go-getter Peter B. Kyne's hero isn't in it with "Gus." Wagner, the lad, got his job with the Detroit United by his frank answers. He was one of a bunch of candidates. When young Wagner was asked by Mr. Stanley if he smoked, Gus replied that he did when he could afford it. The whole philosophy of the man is contained in that remark.

How this doctrine became inculcated in the boy does not matter. He had it. And it was the ladder on which he has climbed to success in the railroad world. Young Wagner did everything he was told to do and a lot more than he was told to do. He carried the message to Garcia. Shortly D. U. R. officials began instinctively to turn to Wagner when they wanted anything done. The world was making a beaten path to his door. The Emersonian-Hubbard bit of philosophy was being proved. For five years Mr. Wagner worked in the operating and passenger offices. Then he joined A. F. Edwards in the purchasing department, where he advanced step by step, finally succeeding Mr. Edwards as purchasing agent when the latter became treasurer of the company.

C. B. Fairchild, Jr., President

Executive Assistant, P. R. T., Elected to Head the Pennsylvania Street Railway Association

C. B. Fairchild, Jr., executive assistant Philadelphia Rapid Transit Company, was elected president of the Pennsylvania Street Railway Association at its convention in Harrisburg on June 1 and 2. Mr. Fairchild has been an officer of the association for the past three years and has been active in promoting its work.

Mr. Fairchild started his work in the electric railway field as an assistant on the editorial staff of the *Street Railway Journal*, upon leaving his course at the College of the City of New York in 1895. In 1899 he became assistant editor of the *Electric Railway Review*, for which publication he traveled extensively abroad and in this country, gaining a very good knowledge of oper-

C. B. FAIRCHILD, JR.

ating practices and railway construction generally. In 1904 he became associate editor of ELECTRIC RAILWAY JOURNAL and in 1906 joined with H. J. Kenfield in starting *Electric Traction Weekly*. He sold out his interest in this paper in 1909 and became statistician of the Chicago City Railway Company, of which T. E. Mitten was then president. He remained in Chicago until 1911 and then went to Philadelphia as executive assistant to Mr. Mitten on the Philadelphia Rapid Transit System. In 1920, in addition to his duties as executive assistant, he was made chief statistician. In 1918 Mr. Fairchild wrote "Training for the Electric Railway Business," published by Lippincott as one of a series of books on how to train for business.

Fairchild, the younger, as Charlie is familiarly known, is of the second generation of that family to be prominently connected with the industry. His father was editor of the *Street Railway Journal* in the early nineties. The father was primarily an editor and author and secondarily a street

Digitized by Google

railway man. With the son, however, the process has just been reversed. While he was first of all an editor, still the real work of Mr. Fairchild, Jr., has been done in active street railway service, to which he has applied the talent of tenacity which necessarily is a part of the equipment of every successful journalist. It is pretty well assured that under Mr. Fairchild the work of the Pennsylvania Association will be carried forward vigorously, for he knows well the needs of such associations, both from his long service with the industry and from the inside as a result of his connection some years ago as secretary of the New York State Street Railway Association.

D. H. Blanks Resigns

The Monongahela Power & Railway Company, Fairmont, W. Va., has announced that Major Don H. Blanks, manager of railways, has tendered his resignation to become effective on June 1. At that time he will become a partner of a general contracting firm at Greensburg, Pa.

E. B. Moore, general manager, announced that W. C. Kline, who for a number of years has been chief engineer of the local company, would assume Major Blanks' duties under the title of acting manager of railways and would hold that position with his own, until a permanent successor is chosen.

Major Blanks joined the Monongahela Power & Railway Company in 1916 as chief engineer, assuming direction of the lines then under construction. He had had previous experience in steam railroad construction with the Pennsylvania Railroad, the New York Central & Hudson River Railroad and the Long Island Railroad. He later was connected with the Southern Pacific Railroad in Mexico. Before joining the company at Fairmont he was associated in the construction of the line between Cumberland and Connellsville for the Western Maryland Railroad. He is a graduate of the University of Missouri.

J. F. O'Hare Made Boston Elevated Trustee

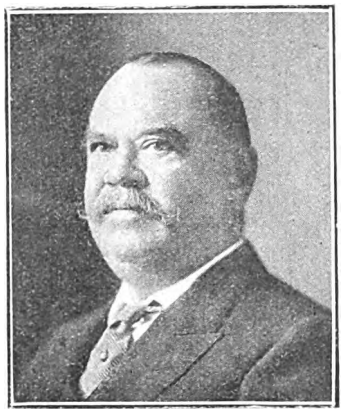
J. Frank O'Hare has been appointed by Governor Cox of Massachusetts as a trustee of the Boston Elevated Railway, to fill the vacancy caused by the death of John F. Stevens. He is to be the labor representative on the board of public trustees, as was Mr. Stevens.

Mr. O'Hare has held numerous positions with state committees and state commissions as the representative of labor.

He was appointed by Food Administrator Herbert Hoover a member of the New England Milk Commission, the Fair Price Committee and the Federal Food Board of Massachusetts, served as a member of the State Fuel Administration, Boston Fuel Commission and in 1918, was made a special assistant to the New England Fuel Administrator. In 1919 he was appointed by Governor Coolidge to serve on the Advisory Fuel Committee to meet the crisis caused by the marine engineer strike. In 1921 he was appointed by Governor Cox to serve on the committee to investigate the request of the railroad executives of New England for an increase in freight rates. Mr. O'Hare is a member of the Boston Printing Pressmen's Union.

W. E. Dunn Heads California Association

W. E. Dunn, the recently elected president of the California Electric Railway Association, has lived in California for some thirty-five years. He studied law in Michigan and was admitted to the bar in that State, but went to California at the age of twenty-one and began the practice of his profession in Los Angeles. After serving some years in the city's legal department (for two terms as City Attorney), he entered the local legal department of the Southern Pacific Railroad. Here he became associated with H. E. Huntington. That was about twenty-five years ago and close association with the Huntington interests has been continuous ever since.



W. E. DUNN

When Mr. Huntington began the organization and construction of the Pacific Electric system, Mr. Dunn gave up his position with the Southern Pacific to work on the new enterprise. When the Pacific Electric was sold to the Southern Pacific, Mr. Dunn again resigned to stay with Mr. Huntington and took active part in the operation of the Huntington properties. Mr. Dunn has been identified with the Los Angeles Railway since its inception; first as attorney in connection with some fifteen or twenty other Huntington properties, and for the last four years as vice-president, representing Mr. Huntington in an executive capacity and devoting all his time to the Huntington companies.

Mr. Dunn is well known as an attorney; in addition to his railroad work he has been a partner in a firm of practicing attorneys for twenty-five years. The firm name, now Gibson, Dunn & Crutcher, is still being continued, but Mr. Dunn is no longer in active practice.

New Public Relations Department Established

A department of public relations was created on April 15 by F. C. Chambers, president of the Des Moines City (Iowa) Railway. It is headed by E. L. Marriage, assistant to Mr. Chambers. Mr. Marriage is a new man in the city railway game, but has had considerable experience with the public, and the department is being received very kindly by the public and press of Des Moines. It is already operating to the distinct advantage of the street car riders of the city. Complaints and suggestions are getting immediate attention and the company is finding that its contact with the public is getting closer every day.

The clubs and civic organizations have all demonstrated a willingness almost unexpected to co-operate with this new department and the new official is being kept busy with these bodies and beneficial results are already being obtained.

The work of the department will not be confined to the public alone, a great deal of its work being centered upon the relations of the company with its own employees.

P. J. Mitten, President of Mitten-Traylor Inc.

After twenty-five years' experience in the electric railway field, the latter ones with the Philadelphia Rapid Transit Company, P. J. Mitten now takes on new duties as president of Mitten-Traylor Inc. Throughout most of his long career in the traction industry. Mr. Mitten has been closely associated with his brother, Thomas E. Mitten, collaborating with him in the development of the near-side car and many other modern traction improvements.

In his recent capacity as chief engineer of the Philadelphia Rapid Transit Company, Mr. Mitten has been serving on a special committee investigating all new forms and developments of transportation, chief of which has been the motor bus. This investigation included a study of the use of the motor vehicle in England and other foreign countries.

In Mitten-Traylor Inc. Mr. Mitten plans to engage in a broader field of service to the entire industry in the making of engineering analyses, managing and assisting in the financing of public utility properties and in the distribution of the Mitten-Traylor Motorbus, trackless trolleys and gasoline trail cars.

With Mr. Mitten is now associated J. F. Collins, formerly general engineer of the Philadelphia Rapid Transit Company, now chief engineer of Mitten-Traylor Inc. Mr. Collins, prior to his Philadelphia Rapid Transit connection was mechanical officer with the Field Artillery, A. E. F. When the war broke out, he left his position as general manager of one of the large motor truck manufacturing companies, to join the colors.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Foreign Trade Convention Results

The ninth foreign trade convention, recently held in Philadelphia, Pa., resulted in the advancement of a large number of ideas for the improvement of foreign trade in the United States and the restoration of normal trade conditions throughout the world. A statement which was read and adopted at the banquet which closed the convention concluded with: "Our foreign trade has suffered in the past through lack of persistent efforts to hold and develop fields in which a footing has been gained. This is the time above all for activity, courage and persistence. It is peculiarly essential to remember that it will cost much more to regain in the future a business lost now through lack of courage and tenacity."

The fact that conditions in Europe are far from satisfactory was brought out at the convention, and it seems certain that a complete resumption of foreign commerce cannot be looked for until they have improved. A large number of suggestions which no doubt will prove beneficial were brought forward.

Conditions Good in Portland

The Portland (Ore.) Railway, Light & Power Company will spend over $600,000 in 1922 on track renewal and paving work on the city lines. The Portland company is feeling optimistic about business conditions. The general business of the city is going ahead on a substantial basis. There is a very good demand for lumber for both export and domestic markets and the heaviest local building in the history of the city is also in progress. Another indication to the company of the general prosperity of the community is the readiness with which it has been able to dispose of its 7 per cent prior preference stock direct to the public. Of this stock, $600,000 was disposed of in the first ninety days.

Trend of Prices of Building Material and of Building Wage Rates Since 1913

That the years during and since the World War have witnessed radical changes in the wage rates of the building trades, and not only radical but spectacular changes in the prices of building material, is forcefully brought out in an article in the May *Monthly Labor Review*, published by the United States Department of Labor through the Bureau of Labor Statistics. To show relatively the changes that have taken place since 1913 the accompanying table of index numbers is drawn from the *Review*.

Beginning with 1917, building material prices constantly advanced above building wage rates until 1920, in the spring of which year building material as a whole had reached triple the prices of 1913 and wage rates as a whole had nearly doubled the level of 1913. Beginning with the spring of 1920 and continuing through into 1921 there was a heavy fall in building material prices. Building wage rates, however, more than held their position between 1920 and 1921. The change in the carpenters' wage rate practically coincides with that of all building wage rates combined.

In presenting these figures it is stated that a revision back to 1913 has been made in the index number of wholesale prices of building material previously published. Prices of lumber have been obtained in more representative markets. In addition, structural steel, nails, pipe and a number of other articles are now included under building material.

New Contracts Let for Interborough Yards

The refusal of the Board of Estimate of New York City last year to approve contracts for additional permanent facilities at the Lenox Avenue shops, between 147th and 148th Streets, made it necessary for the Transit Commission to award contracts for temporary facilities, which will later have to be scrapped. The cost of the temporary work will be $50,610. It covers the construction of a temporary shed at the Interborough yards at 147th Street and Lexington Avenue, together with the necessary frogs, tracks, switches, etc. The contractors are John B. Roberts & Company, whose bid for part of the work was $27,325, and the Reynolds Contracting Company, whose bid for the rest of it was $23,285.

Another contract awarded by the commission was for the construction of tracks, switches and bumper posts in the East 180th Street yard of the Interborough company. This contract went to the Slattery Engineering & Construction Company, whose bid, the lowest, was $7,505.

On June 26 the commission will receive bids for the installation of tracks in the Fourteenth Street-Eastern District subway from Sixth Avenue, Manhattan, to a point near Meserole Street, in the Bushwick district of Brooklyn, the end of the subway section of the line. When these tracks are installed and the signal system is ready for use, the subway part of the line will be ready for operation.

Survey of Manufactured Products to Be Made

At the request of Secretary Herbert E. Hoover of the Department of Commerce the American Engineering Standards Committee will undertake a canvass to determine what simplification in manufactured products is most needed and most desirable. This can-

INDEX NUMBERS OF THE LOWEST, HIGHEST AND AVERAGE WHOLESALE PRICES OF BUILDING MATERIALS IN EACH YEAR AND OF UNION WAGE RATES PER HOUR IN MAY, 1913 TO 1921

Building Material, Average 1913 = 100—Union Wage Rates, May 1913 = 100

vass will be conducted through the engineering and technical bodies having representatives on the committee or co-operating in its work.

This assignment to the American Engineering Standards Committee is one of Secretary Hoover's steps to retrieve for American industry a few of the many billions of dollars wasted annually as revealed in the report on waste in industry, which was made not long ago by a committee of the Federated American Engineering Societies. The latter committee found that waste in industry was due largely to an over-multiplicity in number of products as well as to inefficiency in process.

Receivers Plan Improvements

In a petition filed in the United States District Court the receivers of the Pittsburgh (Pa.) Railways propose to increase the one-man car equipment.

Other improvements include the construction of a "Y" on the Etna car line in order that trailers may be attached to motor cars, according to the petition. Additional feeders to cost $8,500 are needed in Penn and Liberty avenues from the Thirteenth Street substation for the use of the return and ground electric currents.

The double tracks in California Avenue, Northside, are in need of repair and it is estimated $35,000 will be required to do the work.

In West Fifth Avenue, McKeesport, it is planned to spend $46,000 repairing the tracks.

The location of the tracks between Dunlevy and Allenport on the Charleroi line is to be changed at a cost of $31,000.

It is estimated that $55,000 will be required to repair the tracks in Island Avenue extension, Stowe township.

In Chartiers Avenue, McKees Rocks, the tracks are in such shape that the receivers believe $27,500 will be required to make them safe.

Improvements in Washington, Pa., are planned at an estimated cost of $93,700. The tracks are to be replaced in four different places.

Nine hundred vacuum oilers, to cost $3,625, will be purchased for use on cars.

Two double-truck steel dump cars and three concrete mixers which will cost $35,000 are needed in the service, the petition states.

Metal, Coal and Material Prices

Metals—New York	June 6, 1922
Copper, electrolytic, cents per lb.	13.937
Copper wire base, cents per lb.	15.75
Lead, cents per lb.	5.725
Zinc, cents per lb.	5.70
Tin, Straits, cents per lb.	32.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.075
Somerset mine run, Boston, net tons	3.15
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	...
Central, Ill., screenings, Chicago, net tons	
Kansas screenings, Kansas City, net tons	2.725
Materials	
Rubber-covered wire, N. Y. cents per lb.	5.75
Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$1.97
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	91.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	96.00

Rolling Stock

Lafayette (Ind.) Electric Railway recently received seven of the new cars from Philadelphia and the remainder are expected shortly.

Tulsa (Okla.) Street Railway will supplement its electric railway service with four buses, which will be placed in operation on July 1.

San Diego (Cal.) Electric Railway placed ten new Birney safety cars in service on June 1 on the Mission Hills line. Express trains of two large two-man cars will be continued in operation during peak-load periods.

Havana Electric Railway, Light & Power Company, Havana, Cuba, during 1921, finished and put into service fifty-one passenger cars, and six old cars of same type were entirely reconstructed. Four equipments of G. E. 52 motors were replaced by G. E. 264 motors.

New Orleans Railway & Light Company has awarded orders for seventy-five cars to the J. G. Brill Company, of Philadelphia, and for twenty-five cars to the Perley Thomas Car Works, of High Point, N. C. The contemplated order was mentioned in these columns in the issue for May 6. The motors will be furnished by the Westinghouse Electric and Manufacturing Company, and the trucks by the J. G. Brill Company. The cars are to reach New Orleans completely assembled, delivery to begin Aug. 1, 1922. The type of car will be that now in use on the St. Charles Street Belt line, which were built at the Perley Thomas car works.

Track and Roadway

Jackson, (Miss.) Public Service Company has started construction work on its tracks to extend the line to the entrance of Livingston Park.

South Covington & Cincinnati (Ohio) Street Railway, Covington, Ky., will lay new rails on Thirty-fourth Street, Latonia, Ky. The improvement will extend a little over 1 mile.

Pine Bluff (Ark.) Company has been making repairs to the car tracks on West Second Avenue. Heavier steel has been laid. The work cost $12,000.

Lafayette (Ind.) Electric Railway is doing the general overhauling on its tracks very rapidly. The Oakland Hill line has been relaid and opened for business. Two other lines will be repaired before using new cars on them.

San Diego (Cal.) Electric Railway has made application for franchises to lay rails on Sixteenth Street between Market Street and Broadway and on Twenty-fifth Street between Imperial Avenue and Broadway.

Indiana Service Corporation, Fort Wayne, Ind., is rushing the work of constructing the addition to the Lakeside Street car line in Fort Wayne to Kensington Boulevard. It is expected that the work will be completed within a comparatively short time.

Winnipeg (Man.) Electric Railway is now extending its double-track line on Academy Road from Ash Street to west of Lindsay Street, a distance of about ½ mile. The cost of the extension will be in the neighborhood of $75,000.

Montreal (Que.) Tramways will lay double tracks from McGill Street to the Lachine Canal at Wellington Street bridge. The company is also planning to construct a double-track line along Shakespeare Road and double track its line on Cote des Neiges Road north from Westmount Boulevard.

Public Service Railway, Newark, N. J., has been directed by the Board of Public Utility Commissioners to pay 10 per cent of the cost of removing its grade crossing at Smith Street, Perth Amboy. The board also directed the Central Railroad and the Lehigh Valley Railroad to eliminate grade crossings in that town.

Little Rock Railway & Electric Company, Little Rock, Ark., will have to pave its portion of Main Street. Work of repaving Main Street from Markham to Eighth Street, will soon begin, and the Mayor of the city promised to co-operate with the street commissioners in compelling the railway to do its share.

Fort Worth, Tex.—It is planned by W. P. Welty of Fort Worth and associates to start construction of an interurban electric railway between Fort Worth and Lake Worth about July 1. Mr. Welty was granted a franchise for the proposed line nearly a year ago. It will be 4½ miles long from the point of beginning in Rosen Heights, a suburb of Fort Worth. It is estimated that the cost of construction will be about $200,000.

United Traction Company, Albany, N. Y., will have to expend nearly $600,000 for new track work in Albany and Troy this year, according to testimony of D. L. Waters, auditor of the company. In Albany the work will be done on Clinton Avenue from North Pearl to Robin Street, and on Second Avenue from South Pearl Street to Delaware Avenue. New rails will be laid on Oakwood and Second Avenues and other streets in Troy.

Ocean City (N. J.) Electric Railroad through its trustee, has requested permission from the City Commissioners to lay tracks and run cars on Central Avenue, from Eleventh to Ninth Street. The cars now run out Eleventh street to Wesley Avenue and along that thoroughfare to Ninth Street. The proposed change will bring passengers a block nearer Asbury Avenue, the main business street in Ocean City. The commissioners have called a public hearing for June 12 on the application.

Portland Railway, Light & Power Company, Portland, Ore., may have a franchise to operate on Fiftieth Street, southeast, and over Foster Road, if an ordinance shortly to come before the City Council is passed. The company

Digitized by Google

long held a private right of way along Foster Road, but when the city took over this thoroughfare some months ago, it yielded its right of way to the city. Following the laying of the sewer lines, recently completed, the road is to be improved and double tracks of the railway are to be laid along the center of the roadway.

Muskegon Traction & Lighting Company, Muskegon, Mich. has requested permission of the City Commission to make some extensive improvements to its property. It desires to double-track its line the full length of Western Avenue, the main business section of the city. It also desires to double-track a portion of its lines on Lake Shore Drive to provide for better service in this section of the city. In addition the request calls for the resurfacing of the streets along much of its line. Owing to the financial condition of the company due to competition with bus lines, it is the first extensive improvements planned in more than two years.

Power Houses Shops and Buildings

Detroit (Mich.) United Railway will build a 150-ft. addition to the paint building of the Highland Park shops and equip it for a machine, truck and body shop to serve the interurban system.

Washington & Old Dominion Railway, Washington, D. C., will transfer its terminal to the Virginia end of the new bridge being built across the Potomac at Washington when that structure is completed. At present the Old Dominion Company maintains its terminal on the District of Columbia side of the bridge. The new bridge will have better facilities for the operation of more electric cars and for that reason it is planned to have the cars of the Capital Traction Company operate across the bridge rather than make its terminal at the District of Columbia end of the structure. The change will be made about Jan. 1, 1923.

Trade Notes

John F. Schurch has been elected a vice-president of Manning, Maxwell & Moore, Inc., and, effective June 1, will take charge of the company's Western sales, with headquarters at the Chicago office, 27-29 North Jefferson Street.

Templeton, Kenley & Co., Chicago, Ill., recently furnished the track department of the Chicago Surface Lines with 206 Simplex jacks to replace a like number of old-type jacks. The order came as a result of an eighteen-month test to determine the effectiveness of the Simplex jacks in reducing construction and repair costs and their ruggedness and durability.

Anaconda Copper Mining Company reports a good wire business on the Pacific Coast and states that during the last two days it has booked an order for another 1,000,000 lb. of wire from the Pacific Gas & Electric Company. Two months ago the Anaconda Company made a final shipment on a 10,000,000 lb. wire order for this concern. The plant, which has a monthly capacity of 8,000,000 of wire and rods, is operating at between 6,000,000 and 7,000,000 at present.

Service Motor Truck Company, Wabash, Ind., through its railroad division has released a large quantity of Midwest 4¼ x 6-in. engines for its gasoline propelled railway coaches. This particular engine is a comparative newcomer in the Midwest line, having been developed for heavier duty requiring high speeds. It develops and is guaranteed 59 hp. at 1,200 r.p.m. and 70 hp. at 1,500 r.p.m. The torque peak is increased 50 per cent over that of the 4¼ x 6-in. Midwest engine.

Carborundum Company, Niagara Falls, N. Y., has arranged with the Rothacker Film Manufacturing Company for the production of a film entitled "The Jewels of Industry" which is virtually a survey of American industry. The picture shows how carborundum is produced at the temperature of 4,000 deg. F. The film visualizes the various processes by which crude carborundum is converted into grinding wheels and other forms of abrasives to meet the needs of industry.

Nic Le Grand has purchased the machine shop and brass foundry in Rock Island which has been manufacturing the truck and car parts that he has been selling to the electric railway field, and has incorporated under the firm name of "Nic Le Grand, Inc.'" With these manufacturing facilities under his own control Mr. Le Grand will be in a better position to furnish the electric railway companies with what they want in the way of small manufacturing parts, to enlarge his field of usefulness and improve his capacity for service to the electric railways.

General Electric Company, Schenectady, New York, has decided that in order to establish all of the necessary equipment for railway motor construction in the Erie plant the railway controller department is being transferred from the Schenectady works to this plant. The department is to be enlarged gradually and to start with, will employ from 125 to 150 men to be selected in Erie. H. A. Nye, who is director of industrial service, said that the Erie works does nearly all of the railway motor work and the transfer will help to give the plant more complete equipment.

New Advertising Literature

Sherwin-Williams Company, Cleveland, Ohio, has recently issued a new insulating varnish catalog.

Schweitzer & Conrad, Inc., Chicago, Ill., has issued Bulletin No. 108 descriptive of the Type R pole top air break switches. The success of the improved design of these switches is the message of this bulletin.

Allis-Chalmers Manufacturing Company, Milwaukee, Wis., has issued Bulletin No. 1123 "Small Steam Turbines." This line of turbines is suitable for driving condenser auxiliaries, exciters, small generators, etc.

Fort Pitt Spring & Manufacturing Company, Pittsburgh, Pa., has just issued catalog No. 3 relating to coil and elliptic springs. Specifications for various types are given, together with information as to their capacity.

Roller-Smith Company, New York, N. Y., has issued bulletins Nos. 560 and 820. The first of these describes the company's line of circuit breakers, types E and P, and the latter PV ammeters, voltmeters and small direct-current instruments.

General Electric Company, Schenectady, N. Y., has just issued bulletin No. 47,326, describing its type QC-3 quick break lever switches. These are used for voltages up to 600 and for currents up to 1,000 amp. Dimensions of these switches are fully explained.

Ohio Brass Company, Mansfield, Ohio, has issued a folder describing the National trolley guard. This guard is a trough of wire mesh inserted over the trolley wire for use at grade crossings and other points where the jumping of a trolley wheel from the wire would result in a dangerous condition.

Westinghouse Electric & Manufacturing Company, Pittsburgh Pa., has just published a catalog supplement describing the company's line of insulating and soldering compounds. It is known as 5-A, Supplement No. 2, and describes baking and air-drying varnishes, insulating compounds, finishing materials, including paints, enamels, lacquers, etc., insulating glue, soldering flux, and lubricating oil.

Day & Zimmerman, Inc., New York and Philadelphia, have published in pamphlet form a code of ethics drafted for and in use by that organization. The code includes such maxims as: He profits most who serves best; the honesty which is unswerving; the honor that scorns unworthy deeds; no man liveth unto himself; the courtesy of kindliness; the loyalty that defends its own; no man is free who is not master of himself; life's best triumph is the triumph of principle; whatsoever things are worthy; keep the faith. Each rule is expanded by explanatory text.

Cooper Hewitt Electric Company, Hoboken, N. J., will publish a series of industrial lighting briefs to deal with important phases of the subject. Two of the series have been issued recently, one called "Industrial Lighting in Theory and Practice," by E. Leavenworth Elliott, which appeared in the *Electrical Review* for Oct.; the other is a digest of an article on comparative cognitive reaction time with lights of different spectral character and at different intensities of illumination, written by Martha Elliott for the *American Journal of Psychology*, in January, 1922.

Spirit of Optimism Pervades A.R.A. Convention

THE happy spirit that a brighter day has dawned for the railroads of this country filled the delegates to the convention of the American Railway Association, Mechanical Division, at Atlantic City this week. Through the electrification of steam roads the electric railway industry has become interlocked with the railroads, and many of the exhibits show equipment of particular interest to electric railways. In size, this year's exhibit of equipment and supplies surpasses anything previously held. This is another evidence of the confidence of manufacturers that the present increase in business will continue in greater proportions.

Supply men and equipment manufacturers have a particular opportunity at this time to show their equipment to officials in many of the railroad branches as meetings are to be held of the Purchases and Stores Division, the Air Brake Association and the Railway Electrical Engineers, as well as the Mechanical Division. Indications are that a large attendance from all branches will result.

No "Battle of the Systems" at International Railway Congress

PRACTICAL interest in electrification appears to be more immediately active abroad than here. One reason is probably because coal is scarcer and consequently more expensive in Europe than in this country. Another is the smaller size of the railway systems and, in many cases, a greater supervision of them by the government, most of the countries having government ownership. While such a situation has its drawbacks it has certain advantages, and one of them probably is that standardization both in electrical and other lines is more easily secured. These thoughts are suggested because of the International Railway Congress just concluded at Rome, where electric traction held a prominent place among the questions considered. It was the first meeting since the war of this steam railroad organization, which formerly held meetings every five years, that of 1905 being held in Washington.

It is perhaps most appropriate, at least so far as the electrification papers were concerned, that the meeting was held in Italy, which has abundant water power but no coal of its own. In consequence much of the pioneer work in steam railroad electrification in both direct-current and in three-phase work has been done in Italy. Since the pioneer days, great progress has been made, especially in the direction of planning for a superpower system to unite the water powers of the Apennines and the Alps. With this background it is not surprising that, according to the reports received from abroad, the attendance at the electrification meetings was larger than at the other technical functions of the congress.

If this was because a contest was expected between the advocates of the different systems there was disappointment, because, in general, the conclusions reached were that every system not only has its advantages, but that all are susceptible of considerable improvement. Moreover, where locomotives are changed, no great difficulty is encountered if the new locomotive operates over a different electrical system. This seems a sensible view, and if accepted here the energies now exerted by advocates of individual systems could be devoted to setting forth the merits of electricity as a motive power independent of the system.

What Will Be the Rail Joint of the Future?

DID the attendants at the session of the Quebec convention of the Canadian Electric Railway Association devoted largely to the subject of rail joints appreciate the significance of what they heard? Probably not, with the exception of the way engineers who were present. Fortunately for the discussion, there were on hand, in addition to the Canadians, a number of such engineers who were in Quebec attending a meeting of the American Engineering Association committee on way matters, as well as representatives of the manufacturers of several types of joint.

E. B. Entwisle started the ball rolling with a paper on the standard bar-weld joint and the new butt-weld joint of the Lorain Company. His statement as to the extent of use of the bar-weld joint during the past twenty-eight years indicates that it is entitled to be treated with great respect. Repeat orders praise the joint eloquently. The vigorous development in the art of welding during the past few years, however, brought other types of rail joints to the fore, but they all owe much to this pioneer, because it has established confidence in the weld as a factor in rail joinery.

The electrically welded joint has appealed strongly to way engineers on account of its permanence and self-bonding character. They have felt the need for a type or types of weld, in addition to the bar weld, which would involve less apparatus than that one; something that would be inexpensive even with a few joints. This is one of the reasons for the great interest in the thermit weld, the arc weld and the electric butt weld.

Another good reason for the interest in welded joints generally is the activity of welding engineers and manufacturers of welding apparatus for making rail joints and for other purposes. The war gave this activity a great stimulus. It has come to a head in the committee on welded rail joints, which is functioning under the auspices of the American Welding Bureau. This committee is commandeering the best available technical talent to assist in solving the rail joint problem in its essentials. The details will then work themselves out in accordance with the ideas of individual manufacturers and engineers. In connection

Digitized by Google

with its program the committee hopes to build a testing machine which will permit joints to be subjected in a few days or weeks to a cumulative stressing that in service would require years. They will need money for this, and the industry can well afford to support the program because it will repay its costs many times over. This machine is described on page 977.

One feature of this joint matter which is giving engineers much concern is the effect on the properties of the rail steel of the high temperatures which are involved in all welding operations. Obviously to produce a real weld requires a temperature considerably above the melting point of the steel. Just what this does to the steel is not yet definitely known. Mr. Entwisle said at Quebec that a post-heating of the electrically welded joint to 1,500 deg. F. was necessary to relieve internal stress set up by the process. This fact suggests one line of research which must be followed. Another has reference to chemical effects of high temperature. The committee has thus a lot of work of its own to do, as well as the task of gathering and analyzing the results of the service tests of commercial joints under all kinds of operating conditions.

As to the rail joint of the future, it will be one designed and made in accordance with scientific principles. And is there such a joint now available? Ask the committee.

Effect of New Freight Rates on Electric Railways

THE general 10 per cent reduction in steam road freight rates directed recently by the Interstate Commerce Commission will precipitate much thought as to what steps should be taken with respect to freight rates in the electric railway field. In some instances where there is keen competition a readjustment to the steam road level or possibly a lower rate will be necessary if traffic is to be held. However, before a new lower traffic schedule is put into effect, electric railways should give careful consideration to the possibility of maintaining present rates even though these may be equal to or slightly higher than the competitive steam rates, on the basis of providing a superior service. The electric lines are able to give an overnight delivery between any two points on their respective systems. Such service is more nearly comparable with the express service on the steam lines than with the freight service, and accordingly a higher rate for a faster service is not only justifiable but is salable to the shipper. It would seem to be better business to attract traffic by the quality of service rather than by cut rates.

The Peak of the Strike Load Was in 1917, 1918 and 1919

THE smallest number of strikes of street railway employees for six years occurred in 1921, according to the last issue of the *United States Monthly Labor Review*, which gives statistics of all recorded strikes and lockouts in this country for the six years ended 1921. In 1916 there was the comparatively moderate number of fifty-five street railway strikes. The three following years make up the "rush period," with 118, 117 and 109 respectively. In 1920 the number dropped off to eighty-one, and in 1921 there were only eleven street railway strikes. In addition to these numbers the bureau reports one street railway lockout in 1916, one in 1919 and one in 1921. The number of strikes in other industries follows about the same relative proportions in the different years, although in number of employees concerned, the proportion is different.

Some of the figures involved in the strikes in general industry are tremendous. Thus, to take 1916, which is by no means the year of greatest strike activity, the total duration of the strikes was 46,305 days, and the average number of persons per strike involved was 594, making the total something like 27,000,000 person-days. In 1919 nearly 4,000,000 persons were involved in strikes, and the average length was thirty-four days, making the enormous total of 136,000,000 person-days.

U. S. Supreme Court Declares Union to Be Suable

THE chief point of interest to electric railway companies in the Coronado Coal decision of the United States Supreme Court is the conclusion by the court of the suability of the United Mine Workers of America, although it is not incorporated. This point was not the only one at issue and some of the others were decided in favor of the United Mine Workers, so that the case was remanded to the District Court for further proceedings in conformity with the decision of the Supreme Court.

The reasoning of the court that a union, at least one of the size and nature of the one concerned in the Coronado case, is suable is based broadly on four grounds, although the court admits that in common law an unincorporated association of persons is not recognized as having any other character than a partnership. The first of these grounds is that commercially the union organization is an entity distinct from its members, and as such can hold property, issue notes, register trade-marks and do many other acts like a corporation. The second reason is that legally unions have been recognized in many states as having the attributes of artificial persons who are capable of suing or being sued. The third is the wording of the anti-trust law which includes among those who may be sued "corporations and associations under or authorized by" federal or state laws. Finally, the court points out that the question is after all in essence and principle merely a procedural matter. If the members of a union are liable to suit and recovery, the only question is whether they may not be sued as a body.

This decision clears up what otherwise has been an unreasonable situation. Up to this time the unions have claimed many, if not all, of the privileges while avoiding the responsibilities which go with incorporated bodies. This anomaly is well expressed in the decision of the English Court in the Taff Vale case, quoted in the Supreme Court decision, as follows:

> If the contention of the defendant society were well founded, the legislature has authorized the creation of numerous bodies of men capable of owning great wealth and of action by agents with absolutely no responsibility for the wrongs that they may do to other persons by the use of that wealth and the employment of those agents.

The best interests of organized labor will be served by accepting a position of responsibility in the commercial world. Business men will naturally be much more willing to make a contract with an organization which is financially responsible than one which is not. In fact, a contract must be two-sided to be of any real value. If one side is bound and the other not, the mutual consideration or advantage, which is the essence of every contract, is lacking.

Manufacturing Rolled Steel Wheels

The Author Shows How Certain Changes in Buying Practice Are of Direct Benefit to the Buyer or User of Rolled Steel Wheels—Lack of Familiarity with Manufacturing Conditions on the Part of Users Is a Prolific Cause of Increased Costs and Poor Deliveries

BY GEORGE A. RICHARDSON
Midvale Steel & Ordnance Company
Cambria Steel Company

THE statement was made at a meeting of the Central Electric Railway Association several years ago that while the steam railways of the country were adhering to about nine types of wheels for their rolling stock more than 360 types were in use on the electric lines. This situation continues at the present time with little change.

On another occasion the salesman of a certain company went into the office of one of the officials of a large interurban system and was tendered an order for a small number of wheels with the statement that quick delivery was imperative. The reply was that if a larger order could be given it would be much easier to get it out promptly. To make a long story short the upshot of the conversation was that it developed that the giving of small sized orders was largely a matter of habit; that they could readily be consolidated into a few good sized ones without any inconvenience.

The important thing in connection with these two incidents is that they typify conditions which have a most important bearing both on the costs and the deliveries of the specialty under discussion. When a salesman makes the statement that a larger order would very likely facilitate prompter delivery it is apt to be considered as good selling talk and in the same way a bid for standardization is likely to seem more a question of benefit to the manufacturer than the consumer.

As a matter of fact lack of familiarity with manufacturing conditions is responsible for this attitude and the object of this article is to point out some of the things involved in the making of rolled steel wheels and show why an approach to standardization of types and consolidation of orders is not only helpful to the manufacturer but is of direct benefit to the buyer and user.

In considering the facts in hand, they must be viewed from two angles: First, that of the practicability of carrying a stock of material or equipment on hand and, secondly, what is involved where small lots of varying designs must be made. While the details of method in the making of rolled steel wheels vary somewhat with the different manufacturers, the essential conditions remain the same. Hence though the writer speaks from the practice of one company, the problems involved apply in a greater or less degree to all.

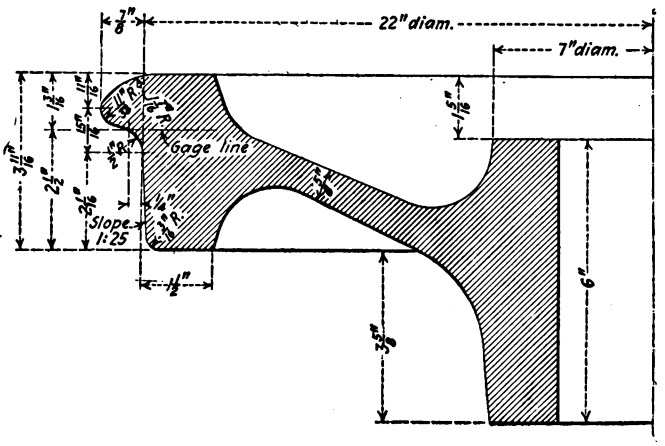
Delivery times are influenced: (1) By the ability of the manufacturer to stock rough or finished material; (2) by the practicability of stocking special equipment, and (3) by the time involved in changing equipment, more particularly with reference to the resultant hold-up in production especially during busy periods.

Extra costs are determined: (1) By the increased overhead resulting from the necessity of carrying large and expensive stocks of special equipment such as dies, rolls etc.; (2) by the necessity of making modifications in equipment on hand or building new; (3) by the actual time and labor involved in changing dies, rolls and other parts, and (4) by the reduction in average daily production necessitated by changing dies, rolls, etc. This is not only a question of the financial loss due to the actual output of the wheels but also entails the losses due to large amounts of expensive machinery and equipment lying idle and increasing the proportional overhead.

STEPS IN MANUFACTURING

In order to have a thorough understanding of just how these things enter into consideration, the best thing to do is to start in at the very beginning and take up the various manufacturing steps one by one, mentioning the practice of one well-known company.

The start of the operations consists in taking sink



FINISHED SIZES OF ROLLED STEEL WHEELS, WITH REVERSE CONING

head ingots having a cross section 22 in. square and rolling them down in a 32-in. mill to round blooms having a diameter of 11 in. or 15 in., according to the size of the wheel that is to be made. These in turn are hot sheared with rotary shears into blocks of the desired length.

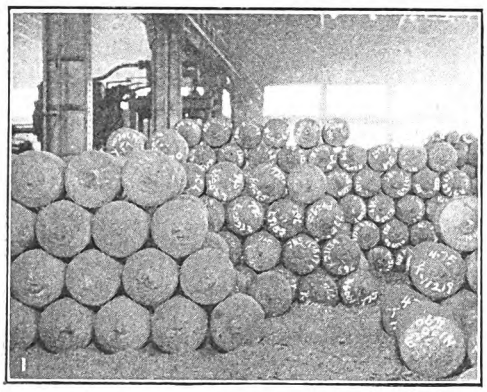
It is customary to carry large stocks of these blocks on hand, 5,000 tons or more, in order to facilitate the getting out of orders, but right here at the very beginning the first difficulty is encountered. These blocks cannot be used for any wheel that is desired. They are only suitable for making the one type or design which they have been cut for. This means that stocking up is limited to a narrow range of the more commonly used sizes of blocks. When the wheels specified are different from those commonly used it becomes necessary to roll and shear specially for the order, which, of course, is a source of delay under the most favorable conditions and may mean additional expense.

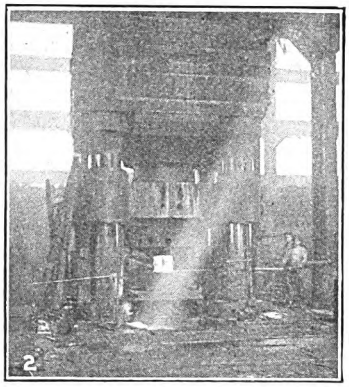
In taking up the conversion of the block into the finished wheel it should be borne in mind that, regardless of all other costs, the one charge of overhead on equipment that must lie idle while changes are being made is not a small one and mounts up rapidly.

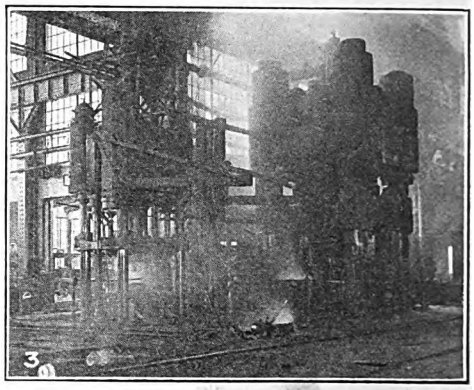
Digitized by Google

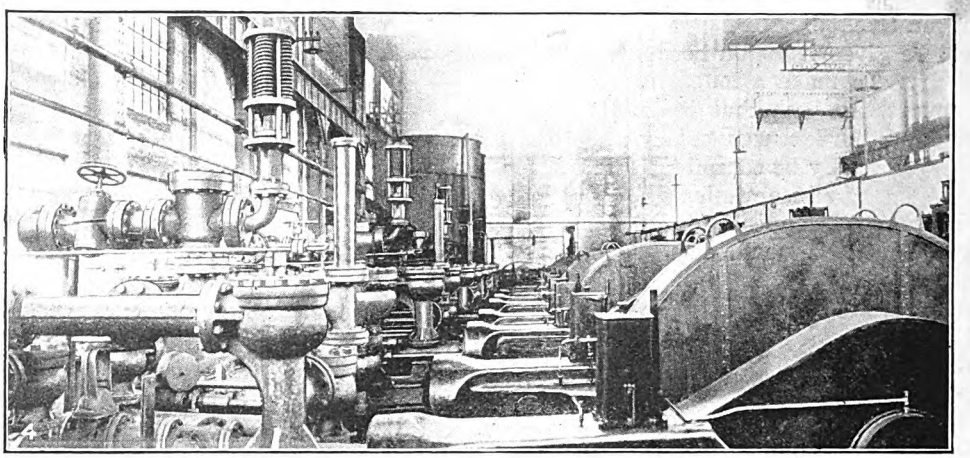
Furnaces must be kept up to temperature, with the consequent consumption of fuel, and output is reduced.

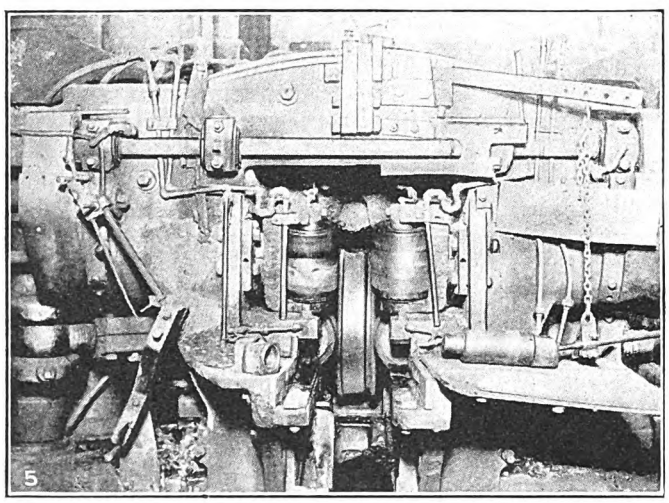
The above does not take into consideration the dies, rolls, etc., that must be used, but merely the basic equipment such as the presses, wheel mills, pumps, etc. When an entirely different type of wheel is to be made a complete change of rolls, dies, etc., is necessary. A full set of equipment for one type of wheel involves an outlay of about $3,000. This may be modified somewhat, depending entirely on the differences in the design of the wheels. Not only is it necessary to make complete changes when a different type of wheel is to be made but it is also imperative that a stock of parts for the more commonly ordered types be carried in stock. At the plant described the total weight of equipment, such as rolls, dies, etc., carried in stock amounts to more than 2,200 tons, the greater part of which is idle at any one time. Standardization would be of immense benefit in making it possible to cut this stock down and very materially reduce the overhead charges as a result.

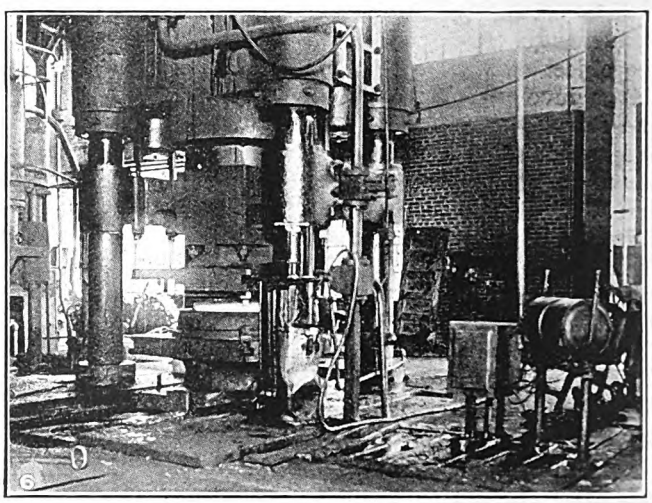












PROCESSES AND EQUIPMENT USED IN MANUFACTURING STEEL WHEELS

No. 6. Coning press.

The layman is not apt to realize the number of parts that are necessary in making the changes in set-up for a given type of wheel. More than twenty-five separate parts are involved weighing from a few hundred pounds each up to as much as 6,000 pounds. Twenty-two of these are illustrated on page 961. From these figures

Digitized by Google

alone it can readily be seen that the time element itself involved in making a complete change is very considerable. The pictures themselves show the rolls, dies, etc., used in making a 33-in. street car wheel. There is little change, however, in general size and appearance for other types of wheels.

Five distinct sets of operations and three heatings are involved in making wheels at the plant under discussion. The blocks are brought to forging temperature and then undergo a first forging operation under a 12,000-ton press. A wash heat follows and then comes the second forging operation under another press of similar capacity. After this the hub is punched. Next in order is another wash heat, followed by rolling in the mill and then pressing in the coning press. The wheel is now ready for hot bed, hot bed inspection, machining and final inspection.

Any change in diameter or width of rim of wheel necessitate a complete change of dies throughout with the single exception of those used on punching press.

When the diameter and rim widths remain the same, but hub diameter or rim thickness vary, a change of die plates is necessitated. As a matter of fact this is really equivalent to changing dies as far as the time element is concerned because the dies must be loosened from their fastenings in order to assemble the plates. Die plates for all standard wheels are carried in stock, but any departure from standard necessitates machining new ones. In many cases, due to the use of a standard counterbore, it is possible to use the same die plate in more than one die. In general the weight of the dies remains fairly constant. In other words, lighter wheels do not mean much lighter dies.

Taking the various operations in their sequence, let us see just what is involved in setting up and changing dies, etc.:

In the first forging operation the block is flattened and part of hub and web started. For this two dies, two web plates and an extractor are required. For a 33-in. freight car wheel the bottom roughing die weighs about 6,000 lb., the top roughing die 4,500 lb., the top web plate about 700 lb. and the bottom web or die plate 100 lb. The forging is done in a 12,000-ton hydraulic press. The time required for changing the dies is about one-half hour and requires a crew of four men, including the crane man.

In the second forging operation the hub, web and flange are formed. Top and bottom second forging or finishing dies are required together with top and bottom web plates and extractor. The weights, changing time, etc., are practically the same. The only difference is in the shape of the contour in the top web plate.

Digitized by Google

Few changes are required at the punching press. The same dies are used for different diameters of wheels, the only time a change is necessary being when the hub diameter varies. When the length of the hub varies this is taken care of by liners which raise or lower the wheel.

The parts required are the punch, mandrel and top and bottom punch dies, which weigh about 200 to 300 lb. each. The time necessary for changing dies at the punching press will average about fifteen minutes, the press operator and two helpers being required.

After the pressing and punching operations mentioned, the wheel is given a wash heat and then taken to the wheel mill and rolled. A mill of the vertical type shown in the illustration is used. Five rolls do the actual rolling. These include a back roll, two web rolls and two edging rolls.

The back roll must be changed for any variation in rim width. This can be taken out without removing the front, the total time required being about one hour.

The edging rolls are never changed except for replacement. They swing on different angles for different diameters of wheels and are adjusted for different widths of wheels. Change of web rolls becomes necessary only in cases where the distance between the inside edge of the rim and the hub is very different.

A complete change takes about one and one-half hours, a time which is shorter than normal due to the use of a patented removable front on the mill which gives ready access to the web rolls and back rolls. Changing the web rolls takes practically the same time as making a complete change as the back roll can be taken out at the same time. Back rolls weigh about 225 lb., while the web rolls, complete with shanks and flange, weigh about 1,500 lb. each.

Wheels are coned and stamped in a hydraulic coning press. Here again top and bottom dies and top and bottom web plates are required. In the plant under consideration solid dies are used, which is a departure from general practice.

The time for changing dies will average the same as in the case of the first and second forging operations.

Inspection and Machining

Change in the type of wheel involves changes in setup and as a result some slowing up in production. The biggest difficulty at this stage is encountered when other than standard contours are specified because it then becomes necessary to make special tools. The effect of changes on the time required for inspection is practically negligible.

The data and information given herewith in themselves would have little of interest to the average outsider, but viewed in the light of the effect of changes of specification and variety of orders they become quite important because they bring home very forcibly some of the reasons why standardization and consolidation of orders are advantageous.

There are several other things worthy of consideration. In the first place consider the effect of die changes, etc., upon daily production. Under average working conditions it is safe to say that die changes will cause a loss of 10 per cent to 15 per cent in the output, a figure which is not a small one by any means and very definitely influences costs.

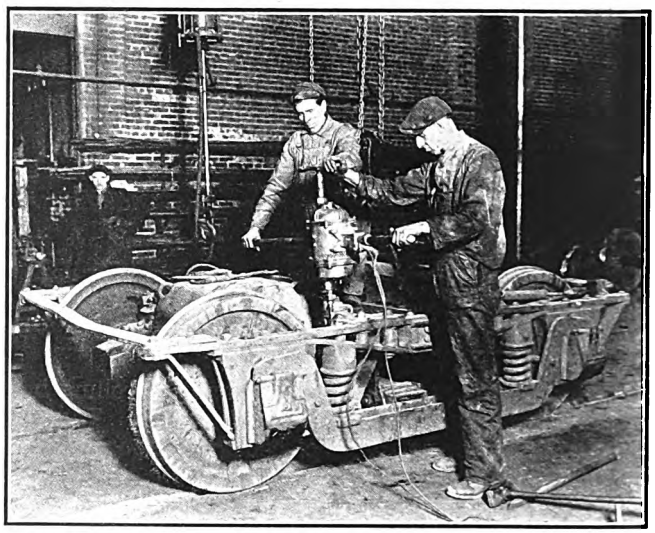
A stock of wheels is a fine thing from the standpoint of making possible very prompt deliveries, but no manufacturer can afford to carry a wide variety of types and sizes. At the plant described from 5,000 to 7,000 tons are regularly carried in stock of the standard sizes and these can be bored to meet customers' requirements. But such a stock does not take care of the many special types which are so commonly met with in electric railway work, nor can it.

It is of interest to note a typical case of modification in design and its effect on cost and to a certain extent on delivery. The wheel shown in the line cut on page 959 has reverse coning. While dies in stock were all right to use, this reverse coning necessitated the making up of a complete set of top and bottom die or web plates for the first and second forging and the coning operations. This meant delay in production owing to the fact that nothing could be done until the plates were machined and added several dollars to the cost of each wheel.

It is hoped that these few facts and photographs which have been presented will aid in showing some of the advantages to be gained by standardizing electric railway wheels as much as possible and also of consolidating orders. In the last analysis, though the manufacturer gains by it, the consumer gains much more. The manufacturer must operate at a profit and his prices are based accordingly. Special designs and small orders at a time, all of which require changes in equipment and the resultant lowering in production, of necessity increase selling prices, while deliveries are hindered.

Portable Drill Makes Dismantling Unnecessary

THE accompanying illustration shows a Little Giant size 4-SS portable electric drill in operation in the Federal Street car shops of the New York State Railways in Rochester. This type of drill is found of special convenience for drilling truck parts and other car equipment so that immediate repairs can be made without dismantling the various parts in order to take them to a drill press. This size drill has a pipe handle



Drilling Motor Suspension with Portable Electric Drill

and feed screw. The drilling capacity of this size is 1½ in. in steel and 3 in. in wood. Electrical connection is made by means of two cables, one for the trolley connection and the other for the ground, which in a repair shop can be conveniently attached to the rail. The New York State Railways has four of these drills.

Keeping Sleet Off Trolley Wires

Experiments Show that Wires Can Be Kept Free of Ice, but So Far No Considerable Applications Have Been Made on a Commercial Scale—The Author Covers the Fundamental Principles and Outlines Possibilities

BY H. H. SENER
Railway Equipment Engineer, Westinghouse Electric & Manufacturing Company

THE collection of current from trolley wires coated heavily with sleet or ice is a problem that has long confronted electric railway operating men. In territories where freezing weather is encountered there are usually several sleet-forming periods during the winter months of each year, when traffic is very badly delayed due to broken wires, burned collectors, etc. In some instances the crust of ice on the wire becomes so thick that it is necessary to suspend operation entirely for periods of from one to three days.

Fortunately, the formation of sleet and ice as a rule occurs within a rather narrow range of temperatures; that is, between — 3 deg. and + 2 deg. C. Under the proper conditions ice will form on practically any object exposed to rain or mist between these temperatures. Metallic objects, however, such as wires and steel structures, are always more heavily coated than trees and buildings, the formations also adhering more firmly to the metal.

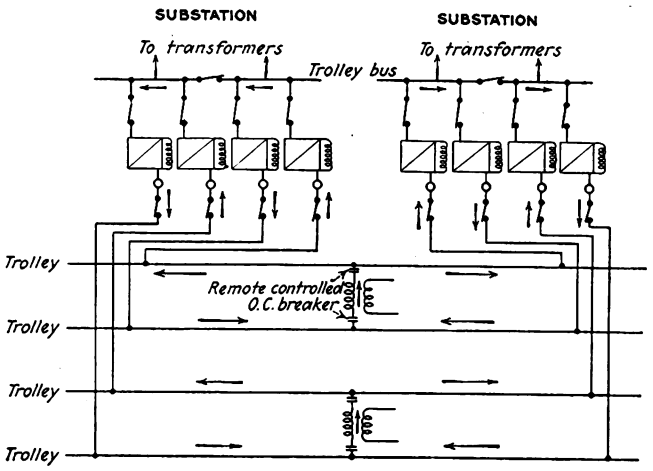
The actual amount of sleet accumulation depends entirely on the severity of the storm and on local conditions, such as elevation above sea level, winds, etc. It is not uncommon during severe sleet storms to have branches of trees and other objects become coated with ice to the thickness of an inch or more. An illustration reproduced shows a rather extreme case on a telephone line where the ice reached a thickness of 2½ in. Ice of much less thickness will insulate the trolley wheel or pantograph completely from the wire.

Numerous ways and means have been devised for combating the sleet nuisance. Some of these have met with a certain amount of success. They may be divided into two general classes: (1) Ways and means for removing sleet, and (2) ways and means for preventing the formation of sleet.

SCRAPING OFF THE SLEET AFTER FORMATION

In the first class are ice scrapers and sleet wheels. The scraper is attached to the trolley pole in such a way as to slide along the wire ahead of the collector, while the sleet wheel has a corrugated groove and acts as a combination scraper and collector. These two devices used separately or together are probably about the only sleet weapons in use at the present time. Still, while they are to a certain degree effective they are somewhat destructive of the wire and overhead construction, and also several cars or motive power units on each line must be so equipped during the sleet-forming periods. In this class, also, are various devices for melting the sleet as the car or locomotive moves along. An example of the heater type is a device which resembles a large electric iron and which is made to slide along the wire in front of the trolley wheel or pantograph in the same way as the scraper. Its main disadvantages are its weight and the fact that it is only effective at very low speeds.

After all of these various devices have been tried and none found that are entirely satisfactory, the railway engineers and also the transmission engineers (who by the way have a similar problem) have been turning their efforts toward finding some way to prevent the sleet from forming on the wire. This is possible if the wires can be kept at a temperature of a few degrees above freezing, so that the particles of ice will be melted or the drops of water will not congeal on striking the wires. Also, in the case of trolley wires,



WIRING DIAGRAM SHOWING ARRANGEMENT OF TRANSFORMERS FOR SUPPLYING CIRCULATING CURRENT TO PREVENT FORMATION OF ICE ON WIRES

a coating of grease or some salt solution can be applied to the wire at intervals which will tend to rot any ice that does form. Both of these methods and the results of some tests made on them will be discussed later.

A few words as to what has been done toward sleet prevention on transmission lines will be of interest in this connection. The troubles produced by sleet in this case are both mechanical and electrical. Mechanical troubles include failure of cables, crossarms, insulators, poles and towers caused by the sheer weight of the ice load, accompanied often by excessive wind load. Electrical breakdowns and short circuits are also possible. They may be caused by long icicles on insulators or between wires; or by mechanical unbalance or distortion, as by unequal sag, due to uneven distribution of the ice load. For instance, all wires may be sagging due to load and suddenly the wind will free the lower wire, allowing it to come up and touch the others, which are still ice laden.

Several companies have been successful in eliminating these troubles by heating their wires during sleet storms, as previously mentioned. For instance, the Niagara Falls Power Company keeps its 2,100-ft. span across the Niagara River clear by transferring the entire load back and forth from one line to the other all

Digitized by Google

Digitized by Google

keep it free from ice, with the following results: With wind velocities varying from 1 to 5 m.p.h. it was found that 225 amp. through a No. 0000 wire, 200 amp. through a No. 000 wire, 175 amp. through a No. 00 wire, or 150 amp. through a No. 0 wire is sufficient. Calculations of the conductor temperature rise in still air at 0 deg. C. with no water spray and with the above current give values of 14.1 deg., 14.2 deg., 14.6 deg. and 13.7 deg. C. for the No. 0000, No. 000, No. 00 and No. 0 wires respectively, so that it may be said that in general, with an air temperature not lower than — 3 deg. C., the current necessary to keep a conductor free from ice in a sleet storm is approximately equal to that current which, in still dry air, will give the conductor a temperature rise of 15 deg. C. above the 0 deg. C. ambient air. For high air velocities this figure should be increased from 100 to 150 per cent.

Grease Is Temporarily Beneficial

In connection with this same test, the effect of grease on the wire was also investigated. One of the wires was coated at three different places with lubricating oil, gear grease and vaseline respectively and was then sprayed with water as before. These different greases while they did not prevent the formation of ice altogether, did, while fresh, prevent it from adhering firmly to the wire. A few days later, however, after the grease had collected dust and dirt from the air, it had no noticeable effect whatever. Still, in territories where the air is comparatively dry and clean it may help the sleet situation considerably, for the coating that forms on the fresh grease needs only a slight jar to cause it to fall. In fact, it may be that the vibration of the wire due to an approaching car or locomotive would be all that is necessary. Grease may be of special advantage to direct-current systems where the current necessary to heat the trolley wire and feeders is almost prohibitive, due to the large current-carrying capacity in the overhead conductors and feeders.

Grease has been used to some extent by some mining companies, which find that it reduces sparking in addition to being of help in the sleet situation. Also the operating men of one New England railroad believe that the grease from the pantograph is responsible for the ease with which the ice can be knocked from their trolley wires.

There are numerous schemes which possibly are suitable for producing a circulating current in the trolley circuit, the one best suited for any system depending on the layout, type of overhead construction, etc., of that system. For instance, a double or four-track road, by reason of having several wires in parallel, presents possibilities for more different propositions than does one with only a single track.

A Plan for Circulating Current Locally

Of the various arrangements that have been suggested, the one that appears to be the best, from various standpoints, is shown in the diagram on page 963. Two transformers for supplying the circulating current are connected midway between two substations, and supply a heating current to the entire section. This flows in the direction of the arrows. The trolley wires are connected in parallel through the substation busbars.

The main advantage of this arrangement appears to be the fact that, due to the complete trolley circuit, there are no losses other than those utilized in heating the wire as there are in other proposed schemes. Its application, however, is limited to systems having more than one electrified track. Practically the same results, so far as sleet removal is concerned, can probably also be obtained on either single or double track by using reactance coils or resistance banks between trolley and ground, but in these there is a superfluous loss in the ground circuit. Also there are large heating losses in the reactors and resistors themselves. There is also the possibility of obtaining a circulating current by means of unbalanced substation voltages. This would be cheapest of all from the standpoint of installation, but the unequal voltages would make the regulation of the system poor during the time substations are unbalanced. Another possibility, which is a modification of the method shown in the diagram, would be to circulate direct current instead of alternating current. This does not seem, however, to have any apparent advantages and besides would require more expensive machinery and more attention during operation.

None of the devices and schemes mentioned has ever been actually used except the old sleet scraper and sleet wheel; the heating devices, the circulating current and the grease having never progressed beyond the experimental stage. Nevertheless, they may be worthy of consideration by railway operating engineers who are having troubles with broken wires or insulators and burned pantographs or trolleys during the sleet season.

Stone Hauling Produces Large Profits

Tiffin, Fostoria & Eastern Railway Earned 86 Cents per Car-Mile with Its Stone Hauling as Compared with 14 Cents for Regular Freight and 0.4 Cent for Passenger Traffic

By R. R. Hayes
General Manager Tiffin, Fostoria & Eastern Railway, Tiffin, Ohio

TO AUGMENT the decreasing revenue from passenger traffic, the interurban operator naturally turns to freight and express business. But, as is the case with the writer's road, the average interurban is limited in freight operations by the lack of terminal facilities. The tremendous amount of road building now under way throughout the country offers an unusual opportunity for interurban operators to bolster up their revenue by hauling road materials for road contractors. Operations of this nature require no terminal facilities and the profits to be gained are disproportionately large considering the equipment necessary.

As an example of what may be accomplished in this respect the following explanation of stone hauling done by our road may be of interest. In the spring of 1921 contracts were let for the rebuilding of roads paralleled by our lines and connecting lines. Stone for this work could be secured from a quarry served by our lines as well as by the highways. Transportation by rail, of course, being much cheaper than by team or motor truck, it seemed to be a very easy matter to get a contract for hauling this stone at an extra margin of profit.

Our equipment at that time did not include the proper kind of rolling stock to handle the job, however, so naturally the proposition resolved itself into finding equipment which would yield profits large enough practically to pay for itself on this first job. We purchased one Differential automatic dump car which seemed ideal

Digitized by Google

for this operation. In addition to its automatic dumping features, its method of placing the material away from the track proved to be very advantageous. A two-way side dump car was used which has many features not to be found in cars of the older type. With this car we were not only able to handle a tremendous amount of stone but were able to distribute it in such quantities as were specified by the contractor.

We began operations with this equipment about July 1, 1921, and continued for three months. The net earnings for the three months from the stone hauling operations represented 81½ per cent of the first cost of the Differential car after deducting taxes, etc., chargeable to these operations.

Our net earnings per car-mile on our different phases of activity are indicative of the great possibilities of this type of operation for electric railways as shown by the following net earnings:

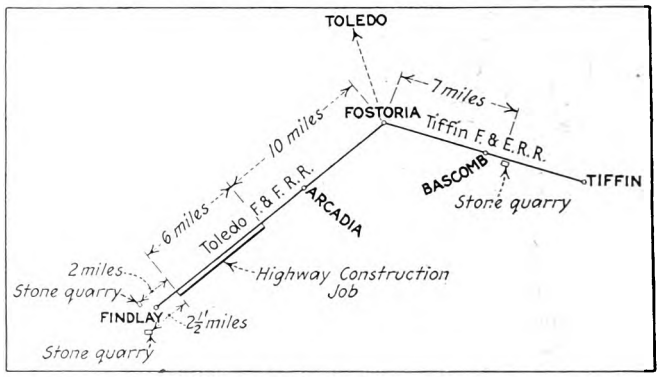
Passenger traffic	0.4016	cent per car-mile
Regular freight	14.1	cents per car-mile
Stone hauling	86.8	cents per car-mile

In explanation of the above it is well to note that these figures are based on the entire year's operation. Also that all expenses and taxes chargeable to each class of business have been deducted.

Another interesting and profitable phase of this operation was our switching and delivering over our lines of more than one hundred steam road cars of road building materials such as cement, asphalt, etc. Our Differential car in this instance served as an electric locomotive, and it was even more satisfactory for this purpose than an ordinary type locomotive, since by varying the load in the car in accordance with the number and weight of cars to be hauled we had at command a locomotive of from 25 to 50 tons.

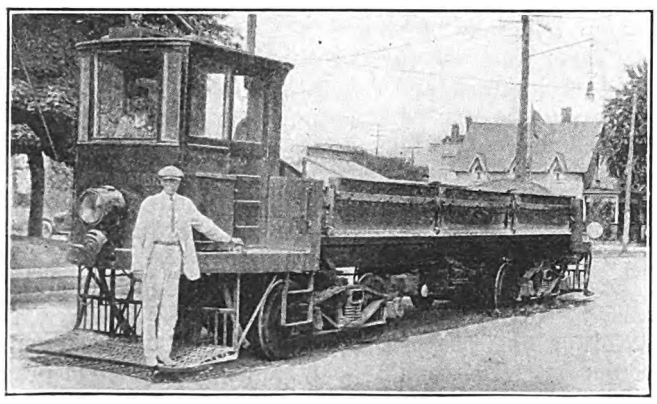
Saves Money for the Contractor

An interesting comparison may be drawn between motor truck and electric railway operation. The biggest part of this job had to be handled over a connecting line as well as our own. The accompanying diagram shows the lines over which the stone was hauled and also the location of the stone quarries at Findlay and between Fostoria and Tiffin. The equipments in operation at the three stone quarries are quite similar, so that the cost of stone at the quarry in each case is practically the same. The map gives the relative distances to the highway construction job, and it will be noted that the average haul for motor trucks is 5 miles, and for the differential car operating over two different railway lines is 20 miles. The contractor said that he saved about $10,000 by purchasing this stone from the Bascom quarry and having it hauled over the railway lines to the job rather than by purchasing it from the Findlay quarry and having it hauled in motor trucks. Our price for hauling this stone included good profits both for ourselves and the connecting company. Still we were able successfully to compete with motor trucks despite the fact that our average haul was 20 miles and motor trucks could have delivered the stone with an average haul of only 5 miles. Even further, our tariff, with good profits included, was so substantially lower than the competition that the road contractor's profit was materially increased. Aside from our low tariff the road contractor was well pleased with our manner of delivering the material, as we were able to place the stone just where he wanted it so as to cause minimum amount of labor on his part. The average tariff over our lines was 32 cents per ton for an average haul of 8 miles. The Tiffin, Fostoria & Eastern Electric Railway furnished the car and received one-half of the tariff from the Bascom quarry to the job. The Toledo, Fostoria & Findlay Railway received the other half of the tariff and paid the Tiffin, Fostoria & Eastern Railway 5 cents per car-mile rental on the car while on its line. That made an average of $1.30 per trip. The average load was 30 tons, and consequently the Tiffin, Fostoria & Eastern Railway received $10.80 per carload, while the Toledo, Fostoria & Findlay Railway received $9.10 per carload. Each railway furnished a man on the car, so that the platform expense was equally divided.



Map of Lines Over Which Stone Was Hauled

For the coming year we anticipate a stone hauling business even larger and more profitable than the year before. We are able to meet all competition by motor or horse-drawn vehicles and still make a very handsome profit.



Type of Car Used for Stone Hauling

Dumping a Load of Stone

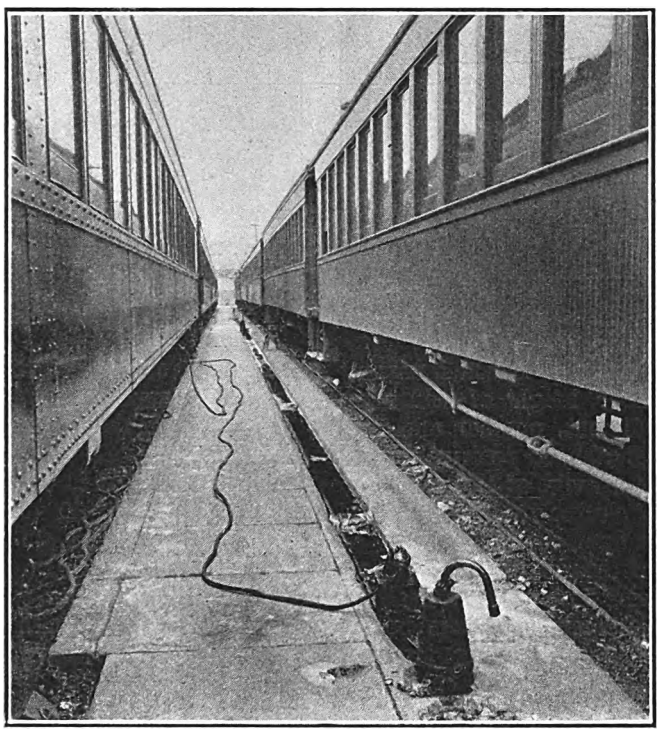
Maintaining Batteries on the Long Island

Complete Facilities Are Provided at the Morris Park Shops for Overhauling Batteries—Yard Is Wired with Convenient Outlets for Charging Batteries Without Removing Them from Cars

THE maintenance of storage battery equipment for lines like the Long Island Railroad which operate multiple-unit cars and maintain the car-lighting equipment of cars in steam service as well is a problem of considerable magnitude. The methods and equipment used for carrying on the work are therefore necessarily more elaborate than those used by the average electric railway. The equipment illustrated and described in this article is that used at the Morris Park shops of the company, where 1,157 sets of car-control batteries, 205 sets of train-lighting batteries and 613 cells used on three storage battery cars are maintained. These batteries are of various makes and types, Gould, Willard, Edison and the Electric Storage Battery Company's batteries being all used.



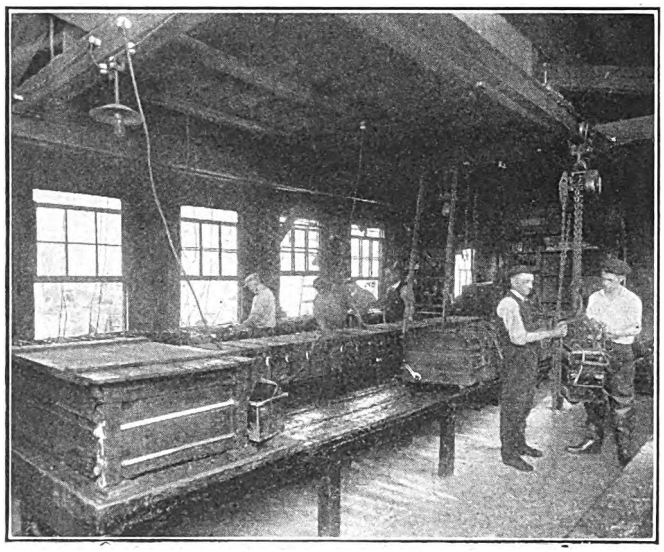
CHARGING BATTERIES ON A TRAIN OF CARS IN THE YARD

The majority of the work of overhauling, testing and charging of batteries is done in a building approximately 20 ft. x 80 ft., which is devoted entirely to this work. All batteries are removed from the cars for overhauling. Periodic inspection, flushing of cells, and charging where necessary, are taken care of in the inspection yard, which has very complete facilities for this work. An accompanying illustration shows a section of the yard between two rows of cars. The yard is piped with convenient outlets for air, steam, gas and water, and electrical connections are run in conduits with frequent outlets. Attachments can thus be readily made for charging by connecting flexible jumpers to the outlet and to the batteries. The current used is furnished by a Westinghouse Electric & Manufacturing Company's motor-generator set installed in the end portion of an adjacent brick building. The generator portion of the set is type SK, 60 kw., 110 volts, 545.5 amp. and 720 r.p.m. The motor end of the charging set consists of a type CCI induction motor of 90 hp. It is connected three-phase on a 25-cycle circuit, of 220 volts, 225 amp. and 720 r.p.m. An accompanying illustration shows the installation of this motor-generator set together with the regulating and charging switchboard panel. The switchboard has two charging panels, with ten charging circuits from the motor-generator set. The regulating of the value of the charging current is done through grid resistors, ten frames of which are installed over each charging panel. When a battery is removed from the car for overhauling, it is entirely dismantled. The connections between the cells are cut apart and the jars are removed from the wooden case. The plates, separators and electrolyte are then removed from the jars, and all are given a thorough washing in the washing room. An accompanying illustration shows the washing tank and various battery parts being cleaned. The wooden boxes are usually set on edge and a stream of water from the hose is directed into them, the force removing all dirt which may have accumulated. After the various parts have been washed, those which appear to be in good condition are set aside for further use, while the others are discarded.

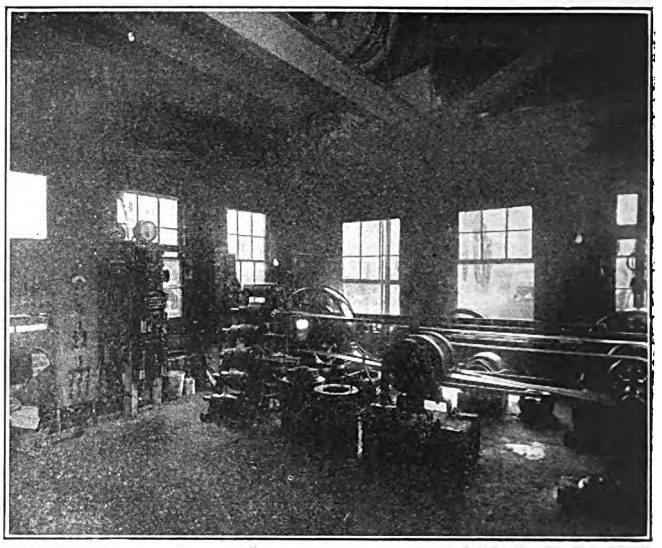
The reassembling of the elements in the jars and the connecting and installing of the units in the wooden trays are done in a room adjacent to the washing room. For the lead batteries chemically pure sulphuric acid of a specific gravity of 1.82 is used. This is diluted to 1.21 by adding distilled water. This is then added to the jars preparatory to charging them. In charging both specific gravity and cadmium readings are taken every two hours for the first four hours (that is, two readings) then every half hour for the last four hours. The specific gravity at the end of the charge is 1.23. In charging control batteries, 5 amp. is used, and in charging the train-lighting batteries the charge is started with 60 amp. for two hours and then 45 amp. for the remaining six hours is used. In order to insure that the electrolyte is chemically pure, this, together with all water used, is tested chemically for copper, iron and nitrates. Also, whenever a battery is reported for trouble in service, the electrolyte in the cell is tested chemically.

Batteries are brought in for general overhauling once in two years and, of course, any batteries found on inspection which need overhauling are ordered in. All batteries are numbered and records are kept by battery number. Whenever a battery is overhauled detailed information is entered on a form, which is sent to the office of the superintendent of motive power for recording. This information consists of battery number, car number from which battery was removed, date

Digitized by Google



THE ASSEMBLING AND CHARGING DEPARTMENT. A TRAVELING OVERHEAD HOIST SERVES THIS ROOM



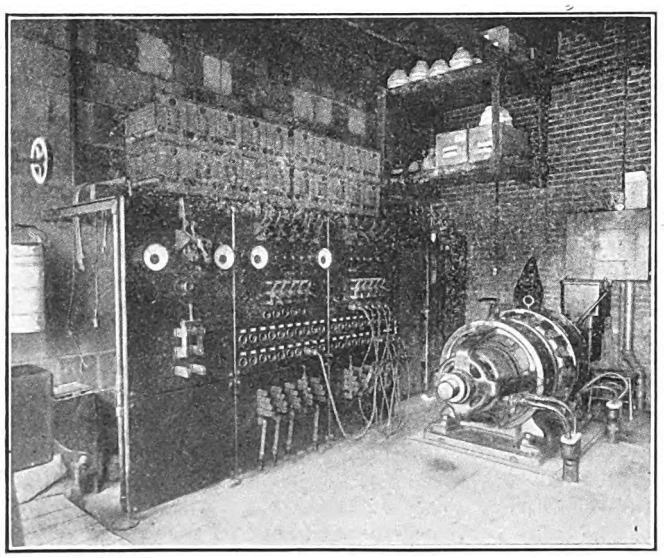
A CORNER OF THE GENERATING ROOM. CAR-LIGHTING GENERATOR READY FOR TEST IN THE FOREGROUND

removed, date overhauled, car number to which battery was returned, shop order number, height of acid when received, average depth of sediment, number and type of plates scrapped, average lengths of positive plates, condition of terminals, specific gravity of electrolyte on arrival, specific gravity of electrolyte before final charge, specific gravity after final charge, number of hours charged, average rate of charge, capacity of battery at time of overhauling, cadmium volts to positive, cadmium volts to negative, total ampere-hours put in while charging, material used in overhauling, together with cost, cost of labor for overhauling and total cost.

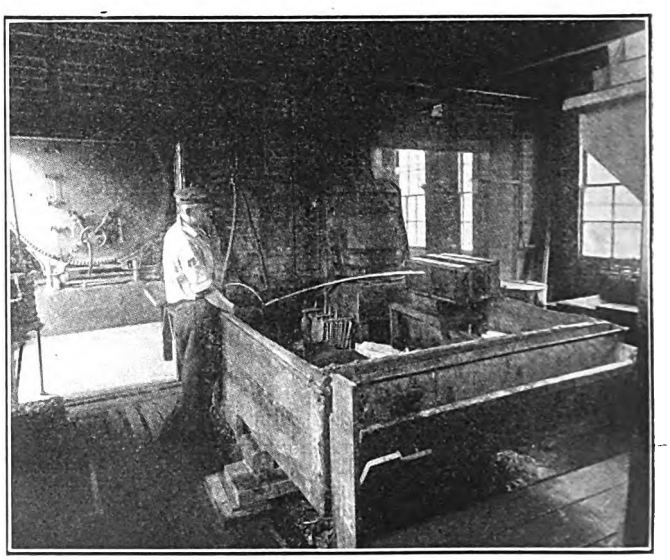
The form also contains space for remarks so that anything unusual found can be noted. The average depth of sediment found after two years service is ¾ in. In addition to the report made out by the battery inspector, a monthly report is sent to the battery foreman giving a list of batteries that have been in service two years or more and are due for overhauling. A monthly report of axle-lighting equipment is also sent to the superintendent of motive power. This gives a list of all material used in maintenance and overhauling, the number of batteries overhauled and a list of the troubles experienced. A record for each battery gives dates of removal and reinstallation and car numbers from which the battery is removed and to which it is applied.

In general the charging current is from motor-generator sets. A small set is used for charging control batteries. This consists of a generator of 1¼ kw. capacity, rated at 50 amp. and 25 volts full load. The motor is three-phase, 25-cycle, 6.2 amp., 220 volts, with a speed of 1,500 r.p.m. A large 30-kw. generator is used for charging car-lighting batteries. This is belt-driven from a Westinghouse Electric & Manufacturing Company's type S, variable-speed, shunt-wound, 20-hp. motor. The shaft of this motor also has a pulley for driving train-lighting generators while they are being tested. In the illustration showing the generating room one of these car-lighting generators is shown set up and ready for tests. Switchboards are provided for the starting and control of the motor and for regulating the battery-charging current. The charging board for the large generator has twelve frames of grid resistors mounted over the top and six lines from the generators to the switchboard and twenty-one lines outside to the battery-charging room. There is an ammeter and voltmeter on both the charging boards and the motor control boards.

Arrangement is also made so that batteries can be



MOTOR-GENERATOR SET AND SWITCHBOARD USED FOR SUPPLYING THE CHARGING CURRENT TO THE YARD OUTLETS

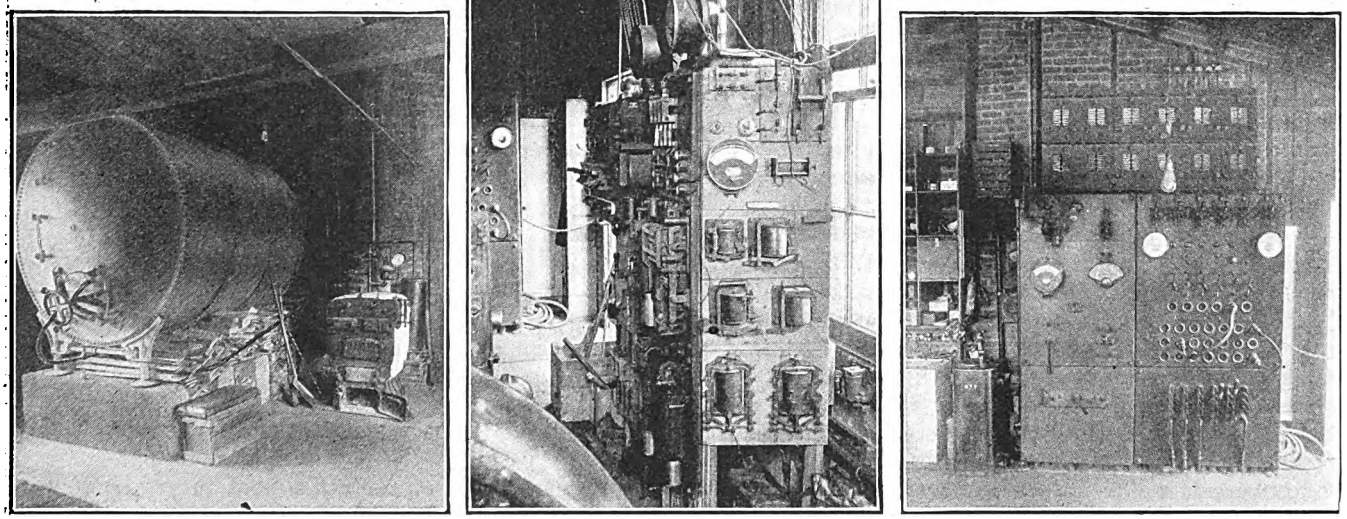


WASHING BATTERY BOXES AND ELEMENTS AT THE WASHING TANK

Digitized by Google

charged from a 650-volt direct-current line through resistance. This method of charging is used only when the volume of work is so great that it cannot be taken care of by the motor-generator set. As the 650-volt circuit is the same as that used for operating trains from the third rail, there is a considerable variation in voltage and current, so that a uniform charging current cannot be readily secured. In charging car control batteries, the variation is between 1 and 5 amp.

Car-lighting switchboards are provided so that when testing out the car-lighting generators they can be connected to the same equipment that they have in regular operation. A lighting load, the same as that on cars, is also provided. Two car-lighting panels are installed in permanent positions; one of these is a Gould Company's Simplex system type B, and the other a Safety Car Heating & Lighting Company's type D, 40 volts, 65 amp. A small wooden board is installed at the end of these car-lighting switchboards, on which various relays and switches used in connection with the car-lighting equipment can be tested out. These can be mounted in the same positions they are located in regular service and can be tested under regular service operating conditions. In testing out car-lighting generators connection is also made to the battery load as well as to the light load.



AT LEFT—DISTILLED WATER PLANT. IN CENTER—CAR-LIGHTING SWITCHBOARD USED FOR TESTING CAR-LIGHTING GENERATORS AND OTHER CAR-LIGHTING EQUIPMENT. AT RIGHT—CHARGING PANELS FOR THE BATTERY CHARGING ROOM

DISTILLED WATER PLANT

For providing the necessary distilled water for overhauling and maintaining batteries a special distilled water plant is installed in the room adjacent to the washing room. This consists of a furnace with boiler, a condenser and a large storage tank. Fifty gallons of distilled water can be produced in eight hours. Water from the city system is fed into the boiler through an automatic regulator. This provides automatic feed through the use of a float so that the height of water in the boiler is kept constant. A steam pressure of from 1 to 5 lb. is used. The condenser is located above the storage tank near the roof of the building, so that the water from the condensed steam is fed into the tank by gravity. Gages on the ends of the storage tank show the amount of water that is available for use.

Experimental Work in Tie Preservation

MUCH experimental work has been done by the United States Forest Products Laboratory in various lines of wood preservation, and probably no class of timbers has received as much attention as the cross-tie. On file at the laboratory are the records of 374 complete studies on thirty-eight species represented by more than 900,000 treated and untreated ties, enough for 300 miles of track. There are included complete data on the treating, time of setting, life, and inspection records, which make possible definite comparisons of the durability of various species, treated and untreated, and the effectiveness of the different treatments. The lack of value of some methods of treatment is evident, and the effectiveness of standard preservatives and practice is clearly shown. Although the exact durability of any specific tie depends upon the species, amount of sapwood, local conditions, and other factors, it has been determined that the average untreated tie lasts approximately seven and one-half years and the treated tie at least twice as long. The material saving in first cost and replacement through use of the treated tie is obvious. Only one-third of the 120,000,000 ties now used annually are treated, but if all were impregnated with some form of preservative, it is estimated by the Forest Products Bureau that 1,500,000,000 ft. of timber could be saved annually for other uses and that the extent of the saving in the track maintenance cost to the railroads would be millions of dollars annually.

Although the first attempts at tie treatment were made in 1838, work on a commercial scale did not start until about 1885. Since then the demand for the treated tie is increasing, partly because of its recognized superior durability, partly because of the increased costs of replacement, and quite largely because of the decrease in the supply of suitable material available near the roadbed and the necessity for using the less durable species. Few uses of wood illustrate more forcibly the conditions of our timber supply than the fact that where once there was abundant supply of tie material where it was needed, it must now be shipped, sometimes thousands of miles.

Equipment and Its Maintenance

Short Descriptions and Details of New Apparatus of Interest to the Industry. Mechanical and Electrical Practices of All Departments

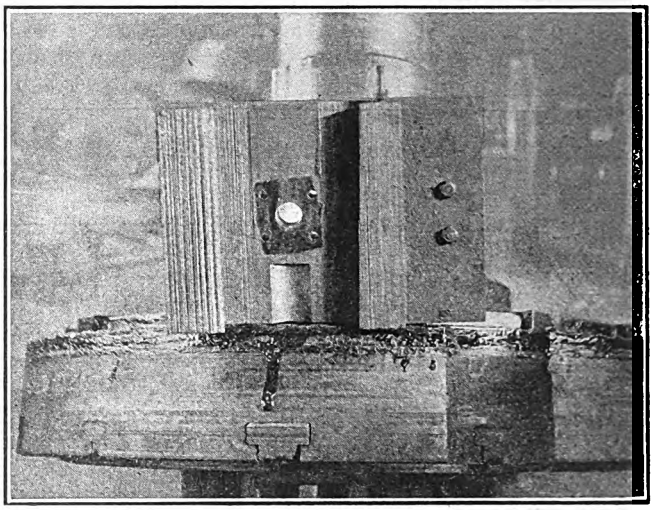
What a $100 Investment Netted

Wheel Lathe Production Doubled by Expending the Above Amount for the Advice of a Machine-Tool Expert and the Repairs Which He Recommended

MANY electric railway shops have wheel-turning lathes which have been installed a good many years. In any particular shop the capacity of a lathe is found to be a given number of pairs of wheels per day and this performance is accepted as the maximum possible from the machine, because it is usually found that any attempt to increase the size of the cut, as is apparently justified by the rugged construction of the machine, makes the tool chatter and the whole foundation vibrate. Such a condition recently existed in the shops of the Northern Ohio Traction & Light Company, Akron, Ohio. Three pairs of wheels per day was the largest number that the operator could turn. Working at this rate the lathe had insufficient capacity to take care of the work involved in the maintenance of the 500 cars operated by the company. Serious consideration was being given to operating the lathe with a night as well as a day shift. However, before this expedient was resorted to, a representative of the Niles-Bement-Pond Company was called in to make an examination with a view to offering suggestions upon the basis of which the lathe performance might be bettered.

The factory demonstrator, after watching the operator turn one pair of wheels, ordered the lathe to be dismantled. The contact surfaces of the tool post carriages were found deeply scored, as shown in the accompanying illustration. This condition, of course, was caused by chips of steel becoming wedged between the carriage and the dovetailed gib. The sliding surface of both carriages was thereupon planed smooth and the carriages replaced. This time, however, means were taken to prevent the recurrence of this trouble. Six pieces of felt were fastened to the edges of both carriages to sweep clean the surface on which the carriage travels.

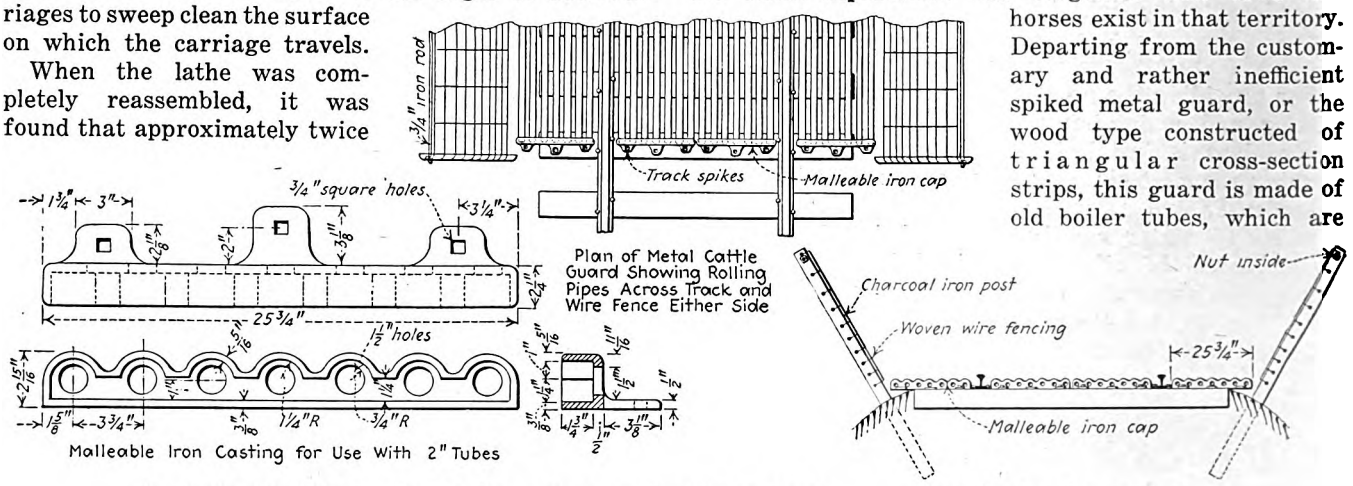
When the lathe was completely reassembled, it was found that approximately twice as heavy a cut could be taken as formerly. Taking this heavier cut, the lathe now has a capacity of seven pairs of wheels per day. Several days time of the factory demonstrator and the labor and material necessary to put the lathe in first-class condition cost about $100. With this more than doubled capacity the same amount of work does not keep the machine running all the time.



THE SCORED SURFACE OF THE CARRIAGE ACCOUNTED FOR THE CHATTERING TOOL

Keeping Stock Off the Track

THE natural trait of an animal to refuse to walk over anything that affords a non-rigid or precarious footing has been utilized by the Scioto Valley Traction Company, Columbus, Ohio, in adopting a metal cattle guard of exceptional effectiveness. In fact, perfection in this respect has been so closely approximated along the 78 miles of its interurban right-of-way that the claim department has forgotten that cows and horses exist in that territory. Departing from the customary and rather inefficient spiked metal guard, or the wood type constructed of triangular cross-section strips, this guard is made of old boiler tubes, which are



EFFECTIVE AND DURABLE CATTLE GUARD MADE OF OLD BOILER TUBES

Digitized by Google

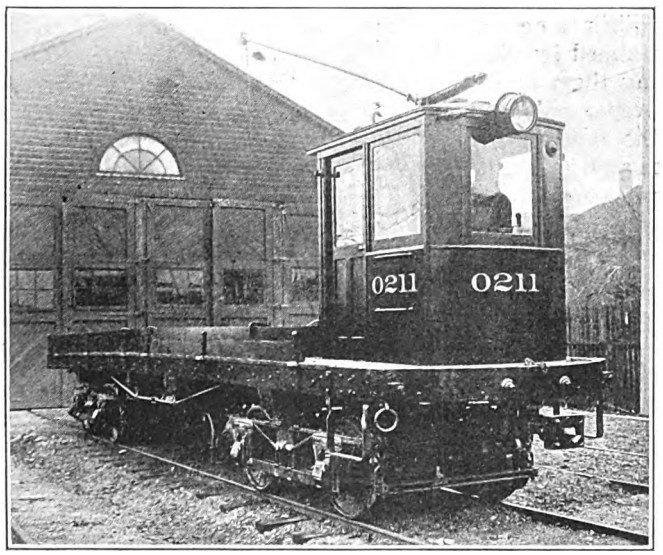
mounted so they will roll when stepped on. Though making the footing uncomfortable, the usual guard is rigid, so that its effectiveness is not all that could be desired.

The end caps of this unique guard, which hold the 2-in. boiler tubes, are made of malleable iron with seven 2½-in. sockets, thus giving the tubes ½ in. of free play. The maximum distance that two tubes can become separated is about 2¼ in., a space which is insufficient to allow an animal's foot to become caught. It is the free rolling motion of each tube as an animal puts the first foot on it that brings into play its instinct to stay off.

The line drawing shows the exact dimensions of the malleable iron end castings, which are the only parts that have to be specially made. The only other work involved is the procuring and cutting to the right length of the old boiler tubes, which are available in large numbers almost anywhere. For protection they are given a coat of weather-proof paint. The installation of these metal guards involves only the spiking of the end caps to the ties. Since the guard is made in sections, for skew crossings each section can be displaced from the preceding one by the amount of the tie spacing. Another feature of this guard is that the length can be readily adjusted by merely cutting off the tube to the desired dimensions. At the sides of the guards, wire wing fences supported with iron posts are used. Maintenance of this type guard costs practically nothing and it is readily removable should the ties or rails need replacement. This metal cattle guard is the invention of Superintendent C. Skinner and it has been patented.

New Motor Flat Car Built by Rochester Railway

THE New York State Railways, Rochester Lines, has recently completed and placed in service a new motor flat car, No. 0211. This car is 37 ft. 2 in. over all and has a width of 7 ft. 7 in. with the side boards



MOTOR FLAT CAR OF NEW YORK STATE RAILWAYS

up and 8 ft. 2 in. when the side boards are down. An operator's cab has been built at one end, which is 4 ft. 6 in. x 6 ft., outside dimensions. All the control equipment, circuit breakers, etc., are located inside the cab. The distance from the rail to the top of the trolley board is 11 ft. ½ in. The sides of the car were reinforced with ¾-in. steel plates, which provide a very substantial construction. The car is fitted with Tomlinson couplers and provision is also made for the use of a bar type coupler, which is necessary with some of the city cars. The car is to be used in connection with construction and maintenance of track and roadway.

Illuminating Fare Boxes

THE problem of providing satisfactory illumination for fare boxes on one-man cars has received considerable attention by the officials of the Hutchinson (Kan.) Interurban Railway. Edwin C. Fearn, master mechanic, has worked out a satisfactory method by connecting a fare box light in series with the headlight. The light is placed in an ordinary tin box, the inside of which is painted white, and a small opening throws the light on the fare box. By connecting the light in series with the headlight, it is possible on dark streets, where few people board the cars, to switch off the fare box light and thus increase the brilliancy of the headlight.

Averaging 150,000 Miles per Pair of Wheels Without Turning

BY A. B. CREELMAN
Master Mechanic Youngstown (Ohio) Municipal Railway

WHEN steel wheels are turned, only the scrap value is received for material which should be worn out and not thrown out. By following a few simple rules, it has been found possible on this system to obtain the full life of wheels without restoring the contour by turning. The cars of this company are equipped with 26-in. steel wheels and, with operation comprising more than 300,000 miles a month, the average life of wheels obtained without turning is 150,000 miles.

The scheme which accounts for this wheel performance begins with the initial mounting of the wheels on the axle. Special care is taken in pairing the wheels to make certain that their tread diameters are exactly the same. This precaution has been found necessary since there is considerable variation in wheels marked with the same diameter as received from the manufacturers. Every axle is tested for trueness and straightened if at all out of line before the wheels are put on. Both the wheel and gear seats on the axle are turned if necessary so that the wheels and gear will have a full bearing. The trucks are carefully squared and all brake rigging put in first-class shape. Brakeshoes are hung so that no side thrust on the trucks will be caused when the brakes are applied. All this work is done when the trucks are in the shop for overhaul.

After a car is in service, the brake rigging is closely watched to see that it is kept in line and that all lost motion is taken up as it develops. Journal brasses are inspected for end play and renewed before the side motion becomes excessive. The axles are kept square in the truck frame by rearranging the shims in the journal box pedestals.

Of course the inspectors are trained to watch the wheel wear very closely as an indication of any faulty truck condition. Wheels that begin to show flange wear on single-end cars are removed from one end of the truck and placed on the other. In this way the wheel wear is balanced so that the same effect is obtained as on double-end cars.

Digitized by Google

Until this practice of closely scrutinizing wheel wear and making provision to prevent it was initiated a machinist was kept busy continually turning new flanges on wheels. In the last three years, however, not over a dozen pair of wheels have found their way to the lathe and these had flat spots to be removed.

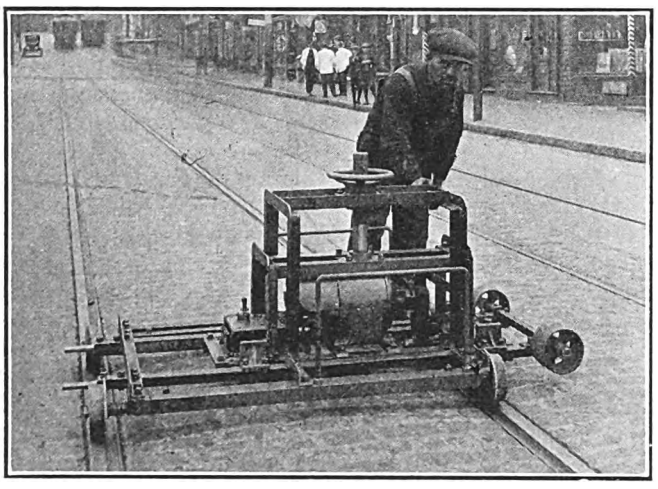
Charlottesville Installs Car Signs to Promote Safety

THE Charlottesville & Albermarle Railway has added a strip of metal about 14 in. long and 3 in. wide to the "Out" door on its cars and has painted these strips red with the word "stop" in white letters. When the operator opens the door this semaphore projects out beyond the car and warns motorists so as to prevent them from running by the car while passengers are being discharged. The sign closes with the door. Destination signs have also been added to the rear of all cars. This was found to be desirable especially on cars where several lines operate over the same track.

What's New from the Manufacturers

Rail Grinder with Derailing Wheels

A NEW type of rail grinder is being placed on the market by the E. P. Seymour Portable Rail Grinder Company of Waltham, Mass. This has been given the name of "Midget" and can be easily and quickly derailed and moved to the side of the track. It has the usual wheels which operate on the rails, but the rail-grinding mechanism is mounted close to one side of the apparatus, which has a third supporting rail. On the same side as the grinder frame is mounted

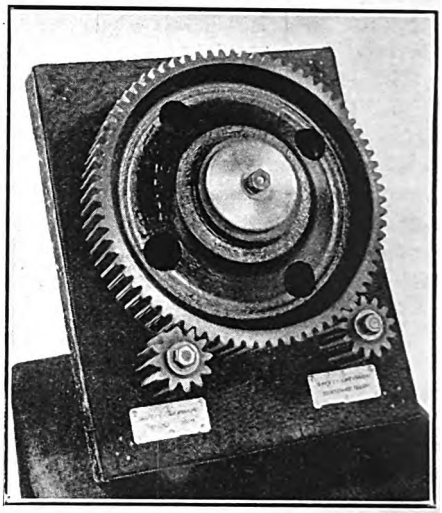


NEW TYPE RAIL GRINDER IN OPERATION

an extension which carries derailing wheels which project beyond the frame of the carriage. On the opposite side of the frame are handles which permit the device to be raised and wheeled off the track in much the same manner as a wheelbarrow is moved about. The carriage holds a rigid movable frame which carries a motor arranged to drive a shaft that operates the emery wheel for grinding.

Special Tooth for Railway Pinions

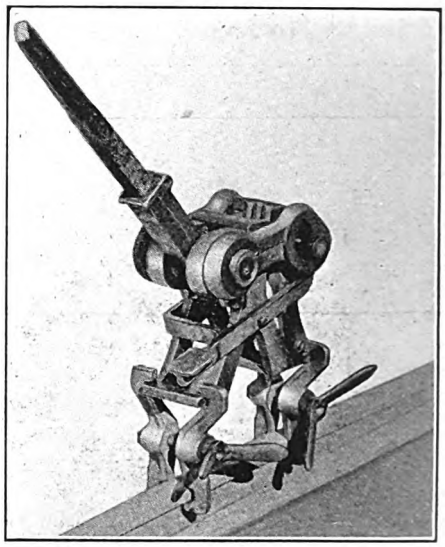
THE Tool Steel Gear & Pinion Company, Cincinnati, Ohio, is introducing a pinion with special teeth. It has been named the "Wisdom Tooth" pinion. As compared with a standard pinion of thirteen teeth the "Wisdom Tooth" pinion has but twelve and is stronger at the root of the tooth. The shape of the twelve-tooth pinion is a true long addendum and it is claimed that this will wear longer than the thirteen-tooth type. The accompanying illustration shows the two types of pinions meshing with a gear. This was exhibited at the recent convention of the Canadian Electric Railway Association.



COMPARISON OF SPECIAL AND STANDARD PINIONS FOR RAILWAY MOTOR OPERATION

Improved Machine for Reclaiming Bent Track Spikes

AN IMPROVED spike shaper was brought out recently by the Werner Machine Company, West Allis, Wis., for the purpose of reclaiming second-hand track spikes at the point where track rehabilitation is in progress. The shaper, which is clamped to the rail, as shown in the accompanying illustration, is light enough so that it can be moved along by the section men as the work progresses. The usable bent and twisted spikes are reclaimed by placing them in the proper groove in the jaws of the machine and pressing them into shape by bearing down on the lever. Should the head of a spike be turned up it is brought back to its original position by a blow with a spike maul. The improved feature of this machine is the slotted link on each side connecting the movable jaw with the eccentric lever pins. After the spike has been straightened and the pressure released the operator then trips the links with a pedal. This action allows the jaw to open sufficiently to let the spike drop through onto the ground. The incorporation of this feature



SPIKE SHAPER WITH JAW RELEASE WHICH ELIMINATES MANUAL REMOVAL OF STRAIGHTENED SPIKES

Digitized by Google

accounts for considerable increase in the capacity of the machine as compared with the older type having a fixed link and from which the straightened spikes were extracted by hand.

The shaper itself is made of steel, while the wearing parts are case-hardened and the movable parts are equipped with roller bearings. The grooves of the machine are made for three sizes of spikes: ½ x 5 in., ⅝ x 5½ in. and ⅝ x 6 in. In a test made recently with the improved model, known as the No. 4 Butler spike shaper, the company claims that two men operating the machine eight hours per day straightened 3,840 spikes, or twelve kegs, at a total cost of $6.40, which amounts to about 55 cents per keg.

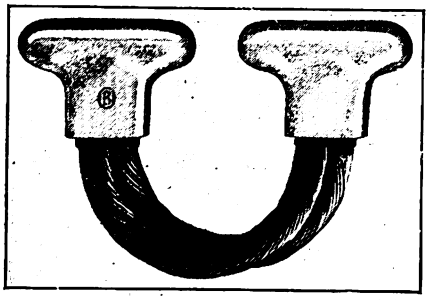
Combined Strain Insulator and Sign

COMBINATION CAR STOP SIGN AND STRAIN INSULATOR

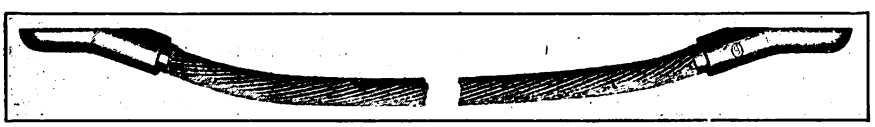
A COMBINATION strain insulator and sign is being manufactured and distributed by the American Porcelain Company, East Liverpool, Ohio. This insulator is intended for the replacement of the iron, enamel or wooden signs which are commonly used by electric railways and attached to span wires. The porcelain sign is made of the same material as are electrical insulators. The sign lettering is fired under the glaze, which makes the part acidproof and insures long life. This type of insulator has been adopted by several of the railways in Ohio as stop signs.

New Arc-Weld Rail Bonds

TWO new rail bonds, for arc-weld application, have been developed by the Ohio Brass Company, Mansfield, Ohio. They are known as Type AW-7 for base of rail application and Type AW-8 for ball of rail.



The AW-8 bond consists of two copper strands formed into a U and welded into steel terminals which, in turn, are welded to the rail. The AW-7 bond is the same in principle. It has a single strand, of any desired length, welded into suitable steel terminals. Steel to steel is the easiest kind of electric welding; the new bonds conform to this principle. The terminals are slightly rounded and provide a wide angle of scarf in which to build the weld. The steel is heavy and will not be burned through by the arc. A copper sleeve surrounding the strands at the terminal shields the wires and absorbs vibration.



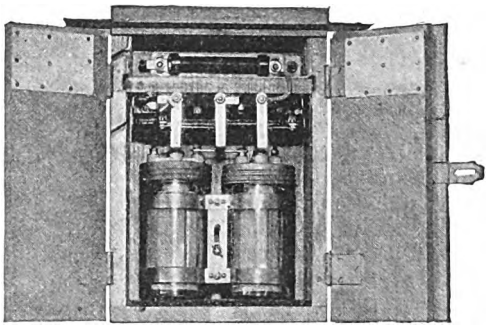
TWO NEW TYPES OF RAIL BONDS

New Type Lightning Arrester

THE Westinghouse Electric & Manufacturing Company has developed a new type of direct-current electrolytic lightning arrester, known as "Type AR," for car or station use on railway, power and lighting circuits. The type "AR" direct-current electrolytic lightning arresters for voltage applications up to 3,800 contain one to twelve cells. Each cell consists of two aluminum plates immersed in a suitable inorganic electrolyte and supported from a porcelain cover clamped by a zinc ring to a glass jar with a gasket placed between the porcelain cover and the glass jar.

Hollow concentric cylinders made from sheet aluminum form the plates, the outer cylinder or plates being punched and upset at frequent intervals in order to allow free circulation of electrolyte within the cell. Balancing resistors are used with arresters of more than one cell. These resistors cause each cell to take its proper portion of the line voltage and thereby tend to keep the aluminum hydroxide films equally formed.

The arresters are "floated" between line and ground so that a leakage current of only a few milliamperes



CAR-MOUNTING FOR DIRECT-CURRENT ELECTROLYTIC LIGHTNING ARRESTER

passes continually. This leakage current serves to keep the film upon the aluminum plate or plates in proper order. The product is capable of passing a surge current of approximately 1,000 amp. at double normal voltage when the arrester is functioning, and one arrester should be used for each 500 kw. of feeder bus, rotary converter or motor-generator capacity to which the arrester is connected. Any voltage in excess of normal line voltage is discharged promptly through the arrester.

The functioning of the "AR" type of arrester is similar to the functioning of a steam safety valve or a hydraulic release valve. When the impressed pressure, or voltage, exceeds the normal, the valve opens and the excess pressure, or voltage, is relieved; then the valve closes and is again ready for operation. A fuse is placed in series with the arrester cells to prevent destruction of the arrester in the event that a short or heavy discharge occurs for an appreciable length of time. Evaporation of the electrolyte in the cells is prevented by a layer of oil on the surface of the electrolyte. The arresters are mounted and securely held in asbestos board and wool-fiber-lined cypress boxes. The boxes with a flat top are intended for mounting beneath the car and with a slanting top for station, car interior, car roof or outdoor mounting on any vertical flat surface. Although all arresters are inherently outdoor arresters, they can be used satisfactorily indoors.

Electrification from the Railroad Point of View*

The Steam Railroad Man Sees Numerous Obstacles in the Way of Changing from Steam to Electric Motive Power, but Is Becoming Convinced that There Is a Field for the Change

BY CALVERT TOWNLEY
Assistant to the President, Westinghouse Electric & Manufacturing Company

WHEN we electrical engineers have discussed railroad transportation we have always done it from the standpoint of proving how desirable it is for the steam railroads to electrify. It occurred to me that it might be worth while for an electrical man to say a few words about the railroad man's natural objections to electrification. Having enjoyed for many years an association with a large railroad system I have had an opportunity to learn something of the railroad man's point of view from the inside.

In the first place, electrification is very expensive. It involves not a small but a tremendous addition to the investment per mile, with the consequent difficulties not only of earning additional interest charges but also those of financing. The day has gone by when the management of a railroad property can have a free hand in issuing securities. Through various governmental agencies the public has established a strict supervision over railroad earnings, is reluctant to permit the capitalization of values created by earning power and is prone to regard railroad securities as having so stable a value that their yield must be limited to a minimum annual interest with little opportunity for the stockholders of the road to obtain large profits from courage and initiative.

The art of estimating in advance the cost of new construction has never reached or even approached perfection; therefore, where such large expenditures as those necessitated by electrification are contemplated it is always possible, due to this fact and due to unforeseen contingent expenses, that the estimated costs will be considerably exceeded. This contingency, combined with the possibility that increased profits might result in rate reductions, may well cause the responsible executives to go slow.

ELECTRIFICATION SUBORDINATES GRADE LIMITATIONS

Electrification upsets some of the fundamentals around which steam railroad practice has been built up, namely, it practically substitutes an unlimited for a limited motive power. This fact is so fundamental and so far reaching in effect that it will bear frequent restating and emphasizing. Due to the large excess in power-house capacity over any possible demands of an individual train, to the characteristic of electric motors to continue to exert more and more power even to the point of self-destruction and, further, to the possibility of operating two or more electric locomotives together in absolute synchronism with one crew and the consequent possibility of getting any desired weight on the drivers, there is practically no limit to the amount of tractive effort that may be utilized for any one train.

Thus, the long-established practice of calling 2 per cent the maximum grade over which a desired schedule can be made goes into the discard and much steeper grades become entirely practicable; likewise the tonnage and speed of freight trains, previously limited by the power of a steam locomotive to pull, are no longer so limited. Freight trains may be as long as the structural strength of the freight cars will permit or as may be handled in the yards and on the sidings. Schedule speeds may be increased to any point considered safe for the track and equipment, being no longer limited by the steaming power of the locomotive. Instead of accelerating from standstill at the rate of ¼ m.p.h.p.s. as is common steam locomotive practice, passenger trains may be accelerated at the rate of 1 to 1½ m.p.h. p.s.

DEPARTMENTAL AND LABOR CONSIDERATIONS

However, to secure all possible benefits from electrification requires the co-operative effort of the construction, operating and the traffic departments. It disturbs the existing order to a considerable extent and redistributes the proportionate burden of expense among the different departments concerned, so that any departmental head may be faced with the necessity of taking on some additional burden in his own department without any compensating advantage, *i.e.*, the advantage goes to another department. In view of the well-established relationship between departments railroad executives cannot be blamed if they regard such innovations with skepticism and retain a considerable reluctance toward their adoption.

The relation between railroad management and railroad labor is a source of continued and great anxiety. There has grown up an inflexibility in both the duties and the pay of railroad labor unparalleled in any other industry. Changes in operating methods are very difficult. Now electrification immediately requires a lot of changes. Not only have the engine drivers all to be educated to a new art but the duties of the fireman are revolutionized. In fact, except as a source of insurance against the death or disability of the engineer while driving his engine, the fireman is not needed at all.

New types of men, the electrical lineman and the electrical shop man, are required, and where a railroad operates its own power houses the power-house crews are introduced. The transmission lines overlap two or more divisions of the road and confuse the duties of the division superintendents. The signal system has to be revamped. These and other features all tend to upset the existing order of relationship between the management and its labor, and the official whose duty it is to regulate these relations may be forgiven if he contemplates with extreme alarm the task presented to him.

On top of this come all the questions of the actual virtue of electrification itself. It is perfectly true that all electrifications heretofore made have been successful and that no road which has electrified would now consent to return to previous conditions. However, not more than about 1 per cent of the entire steam railroad mileage of the United States has been electrified as yet, and the average railroad executive may be excused if he looks upon the existing examples as special cases and therefore as proving nothing with respect to his own particular problem. However, the attitude of mind of the railroad man has materially changed so that the question always first asked some years ago, "Can it be done?" has now been replaced by the entirely different question, "Will it pay?"

I have been and still am a consistent and an enthusiastic advocate of steam road electrification. In reciting the different objections of which I have spoken I do not intend in any way to indicate a change of opinion or a weakening of confidence, but rather because I think it helpful to us all when we can look at any situation from the other man's point of view, and because I firmly believe we can do the cause of electrification no greater harm than to ignore plain facts and out of well-meaning but mistaken zeal advocate electrification where we are not reasonably sure that it will be economically right.

*Abstract of address before Connecticut Section, American Institute of Electrical Engineers, New Haven, May 23, 1922.

Colors for Traffic Signals

Efforts Being Made to Secure Standardization of Signals—Scope of the Work Defined

A CONFERENCE of representatives of a large number of national associations, manufacturers and public authorities interested in traffic signals was held in New York on May 23 under the auspices of the American Engineering Standards Committee. The national organizations represented included the American Railway Association, American Electric Railway Association, American Automobile Association, American Society for Municipal Improvements, American Society of Safety Engineers, Motor Truck Association, National Association of Mutual Casualty Companies, State Highway Officials and National Safety Council. The United States Bureau of Standards and Department of Labor, with the States of Connecticut, Delaware, Maryland, New Jersey and New York, and several cities also sent delegates.

After the meeting had been called

Digitized by Google

to order by A. W. Whitney, chairman of the American Engineering Standards Committee, A. H. Rudd, chief signal engineer of the Pennsylvania Railroad, on behalf of the American Railway Association, presented a paper in which he summarized the general facts of the situation affecting the steam railroads and suggested lines along which they would like to see standardization progress. He said that while signal systems of different railroads differ in some respects, fundamentals are largely standardized. For the operation of trains these include: red for danger (stop); yellow for caution and green for clear. The use of yellow for tail lights of automobiles and of green for fire exits was suggested as steps toward national uniformity. The importance of educating public opinion was emphasized by statistics of railway accidents. The movement for national uniformity should include extensive work with bodies and officers having legal jurisdiction, and should be coupled with a widespread and long-continued campaign of popular education.

A paper by H. B. Flowers, on behalf of the American Electric Railway Association, was then read by Guy C. Hecker. It said that the standard use for night signals in electric railway practice is: red, stop; yellow, proceed with caution; green, proceed at schedule speed. Blue, purple and white are also used in a restricted way, for conveying special information or for safeguarding special conditions. For day signals, hooded light signals showing the same colors are used, but probably in the majority of cases day signal indications are given by means of semaphore arms. For highway protection at grade crossings, when a train is approaching, a red signal either fixed or moving and either steady or flashing is sometimes used, frequently augmented by moving arms, siren horns or by bell signals and the like. Electric railway operators take the view that red should be retained for automobile tail lights instead of changing to yellow as has been suggested. National uniformity in the use of colors was considered most desirable.

Speaking on behalf of the Conference of Motor Vehicle Administrators, A. L. McMurtry said that the administrators felt that they should make no technical recommendations to the conference, but that they were greatly interested in the work and would fully co-operate, provided the recommendations do not entail undue hardships on any interests. If major changes are to be made, such, for example, as a change in the color of tail lights for automobiles, it would take at least two or three years to get such changes into operation, since legislation would be required in some states.

R. J. Durley, secretary of the Canadian Engineering Standards Association, said that the association hoped, as a result of the work of this meeting, to be able to initiate a committee or conference in Canada to arrive as far as possible at conclusions in substantial uniformity with those in the United States.

After a discussion the conference decided that national uniformity in the use of colors for signals was desirable and that the drafting of general recommendations should be taken up by a technical or sectional committee under the auspices of the American Engineering Standards Committee. The scope of the work was defined as follows:

The use of colored lights on all highway vehicles.

Their use on all signals along highways and at curbs, both permanent and temporary.

Their use for highway crossing signals for steam and electric railways.

A co-ordinated relation of color, form, position and number of signals.

A co-ordinated relation to systems of flashing, moving or other similar lights.

Colors for non-luminous as distinguished from luminous signals.

Recommendations on the use of colors for emergency exit signals.

Methods of specifying or defining colors for signal purposes.

Any other closely related matters which, in the opinion of the sectional committee, form a part of the subject to be considered.

Electricity at Rome

Topic an Important Subject of Discussion at the Recent Meeting of the International Railway Congress in Italy

THE subject of electric traction formed Part IV of Section 2 (Locomotive Rolling Stock) of discussion at the ninth Congress of the International Railway Association, held in Rome from April 18 to April 28. The United States was honored by the fact that George Gibbs, chief engineer of electric traction, Long Island Railroad, was president of Section 2. The vice-presidents of Section 2 were Paul Dubois of the Orleans Railway, France; Van Loenen Martinet, Holland Government Railways, and A. Floor of the Danish State Railways.

Mr. Gibbs also presented a paper on the status of electric traction in America. This paper was one of seven on the subject of electric traction, the others relating to the situation in Holland and Great Britain, Belgium, Denmark, Sweden and Norway, Italy, Switzerland, and other countries. Abstracts of these papers have appeared in earlier issues of the ELECTRIC RAILWAY JOURNAL.

These various papers were made the subject of a review by Ernest Gerard of the Belgian Government Railways department, who summed up the situation as set forth by them in a series of four conclusions. The first of these conclusions was that the question no longer was which was the best system, but rather under what circumstances should each system have preference. The second was that international standardization of system is not of great importance because of the ease with which locomotives may be changed at the frontiers of different countries. The third was that, admitting the second statement, much the same condition prevails in the case of two neighboring districts, one having much water power and the other fairly flat. The fourth conclusion of Mr. Gerard was in favor of some standard international bases by which performance of locomotives in different countries can be compared. The discussion at the Congress was largely upon this series of recommendations.

In general the delegates approved the first, and a representative from the Italian government declared that it was much more important to standardize couplings and drawbars than to standardize on an electrical system. He defended the great variety of electric

LENGTHS IN KILOMETERS OF ELECTRIFIED STEAM RAILWAYS*

systems in Italy. A representative from France, however, took the opposite view, and explained that a standard electrical system had been adopted for the conversion of French railroads. A British delegate declared that one of the most important factors in the decision was the question of inductive interference by the railroad current with neighboring telegraph and telephone wires. In England the government has the right to carry these wires along the railroad right-of-way. The delegate from Switzerland, where single phase is used, said that in many cases the public telegraph and telephone wires had been removed from the vicinity of the electrified track, but in other cases this could not be done.

In regard to current collection, the double trolley, the single catenary and the simple suspension were all reported as giving good results, though for fast trains and heavy traffic catenary suspension seemed the only method likely to be satisfactory.

The following resolutions were adopted:

"1. The Congress recognizes that it is no more possible now than in the past to recommend any particular system of electric traction as applicable to all cases. There are several systems to choose from, all of which have proved their value under the severest operating conditions, but the Congress recognizes that these systems are all susceptible of considerable further improvement.

"2. The Congress agrees on the uselessness of standardizing the nature of the current in the contact wire on account of the ease with which locomotives may be changed at the frontier of different countries.

"3. It is to be desired that the methods used for collecting and publishing the statistical data concerning electric traction be well defined and standardized. With this object Section 2 expresses a wish that a special committee of the association be intrusted with the working out of a program dealing with each point in detail so that in the future comparisons may be made by means of entirely comparable figures."

A table of the electrified steam railways in different countries compiled by Ernest Gerard of the Belgian Government Railway department and presented is reproduced on page 975.

Lighter Rolling Stock Favored at Engineers' Meeting

RAILROAD men and automotive engineers got together at a meeting of the Metropolitan Section, Society of Automotive Engineers, held on May 25 in New York. Addresses were given by Roy V. Wright, managing editor of *Railway Age;* W. L. Bean of the New York, New Haven & Hartford Railroad, and by L. G. Plant, associate editor of *Railway Review.* Mr. Wright recalled previous developments of self-propelled cars for rail service and wondered if the present activity was not the crest perhaps of a wave which might fall away in the near future. He called attention to the difficulties of putting rail cars on a production basis. Larger car units than now available will be required, and the development of these is limited by the mechanical transmission. Wind resistance must also be studied more carefully, and it will be necessary to watch carefully the safety requirements incorporated in many state laws. Finally, Mr. Wright said that the rail car must be sold to the public, both as regards riding qualities and general appearance.

The present vehicles, according to W. L. Bean of the N. Y., N. H. & H. Railroad, are a good beginning but they should be designed to eliminate vibration, to drift at less than full engine speed on long down grades, and to give greater quietness and passenger comfort without any loss in the present economy and reliability. The underframe can be lightened in later construction. The only trips lost by the equipment now being tried on the New Haven road were due to airbrake trouble.

R. B. Abbott of the Philadelphia & Reading Railway said that his road was studying types in order to determine the one best fitted for the service, and that after this had been decided upon a car to be tried out would be picked from the desirable types. The operating conditions on this road require motor and trailer or trailers, and control from either end.

G. C. Hecker of the American Electric Railway Association said that the public could be educated to the use of the rail car, just as it had been to the light-weight cars now applied successfully on electric local and interurban lines.

As an automotive engineer A. J. Scaife of the White Company protested against the demand for heavy-weight cars. Rail cars should not be called upon to stand collisions which practically destroy the heaviest locomotives. He also objected to the demand for cars of large capacities when most of the traffic was light. Two cars should be used for rush-hour service under such conditions.

Another speaker claimed that the Master Car Builders' standard resulted in the early development of heavy cars, and that the light cars were a step in the right direction. A detachable power truck that could be taken out for repairs was favored and the solution of the transmission problem by the creation of more flexible internal combustion engines is predicted.

The gasoline-electric car was defended by Henri G. Chatain of the General Electric Company. This type was built when railroad men demanded heavy construction, in spite of the protest of engineers.

Of the old McKeen cars some 150 to 200 are now in use, and about 100 of the G.E., practically all that were ever built, are still in operation, according to Mr. Chatain. One of these recently rounded out 1,000,000 miles of service, and several have covered 600,000 or 700,000 miles. The advantage of the gasoline-electric drive is not alone the flexibility of control, but is even more the possibility of maintaining full load on the engine at different conditions of operation.

American Association News

Nominating Committee Appointed

PRESIDENT ROBERT I. TODD of the American Electric Railway Association has appointed the nominating committee for the year 1922-1923, called for under the present constitution of the association. By the constitution the president has to appoint the committee by July 1 of each year and its report as to officers of the association for the coming year has to be made public thirty days before the convention.

The personnel of the committee follows: Charles L. Henry, Gen. George H. Harries, Thomas Lowry, Edward Dana, H. B. Flowers, B. A. Hegeman, Jr., E. F. Wickwire.

Standardization of Cross Ties

THERE was a meeting of the sectional committee for the standardization of cross ties of the American Engineering Standards Committee in Philadelphia on June 2. The meeting was held at the rooms of the American Society for Testing Materials. The American Electric Railway Association was represented by D. H. Rosell, division engineer of the Public Service Railway, who was present to represent Howard H. George, engineer of maintenance of way of the same company and a member of the sectional committee.

John Foley, representing the American Railway Engineering Association, was chairman of the meeting and Arthur Upson, United States Forest Service, was secretary. The standard specification for cross ties of the American Electric Railway Association was used as a basis for the discussion of the committee and some changes were suggested. At the conclusion of the meeting it was decided that it was probably unnecessary to have any further meetings, as any further modifications could be satisfactorily handled through correspondence.

Claims Association Pamphlet

CECIL G. RICE, president American Electric Railway Claims Association, has in preparation a pamphlet entitled "How a Claim Should Be Adjusted." Its purpose is to point out

Digitized by Google

the advantages of efficient and modern methods in the claim department of electric railway companies, and particularly the benefit which companies will derive from having their claims representatives attend and participate in the fall convention. Mr. Rice declares that if 5 per cent of the money now expended for claims on the average electric railway should be intelligently directed toward accident prevention and claims prevention, it would accomplish greater and more lasting results of advantage to all departments than any previous undertaking within the industry. He considers money expended purely for claims is waste, and it should be turned into productive channels.

He also analyzes some of the excuses made for non-participation in and non-attendance at claims conventions, and quotes various prominent electric railway men upon the importance and benefit of attendance at the claims conventions.

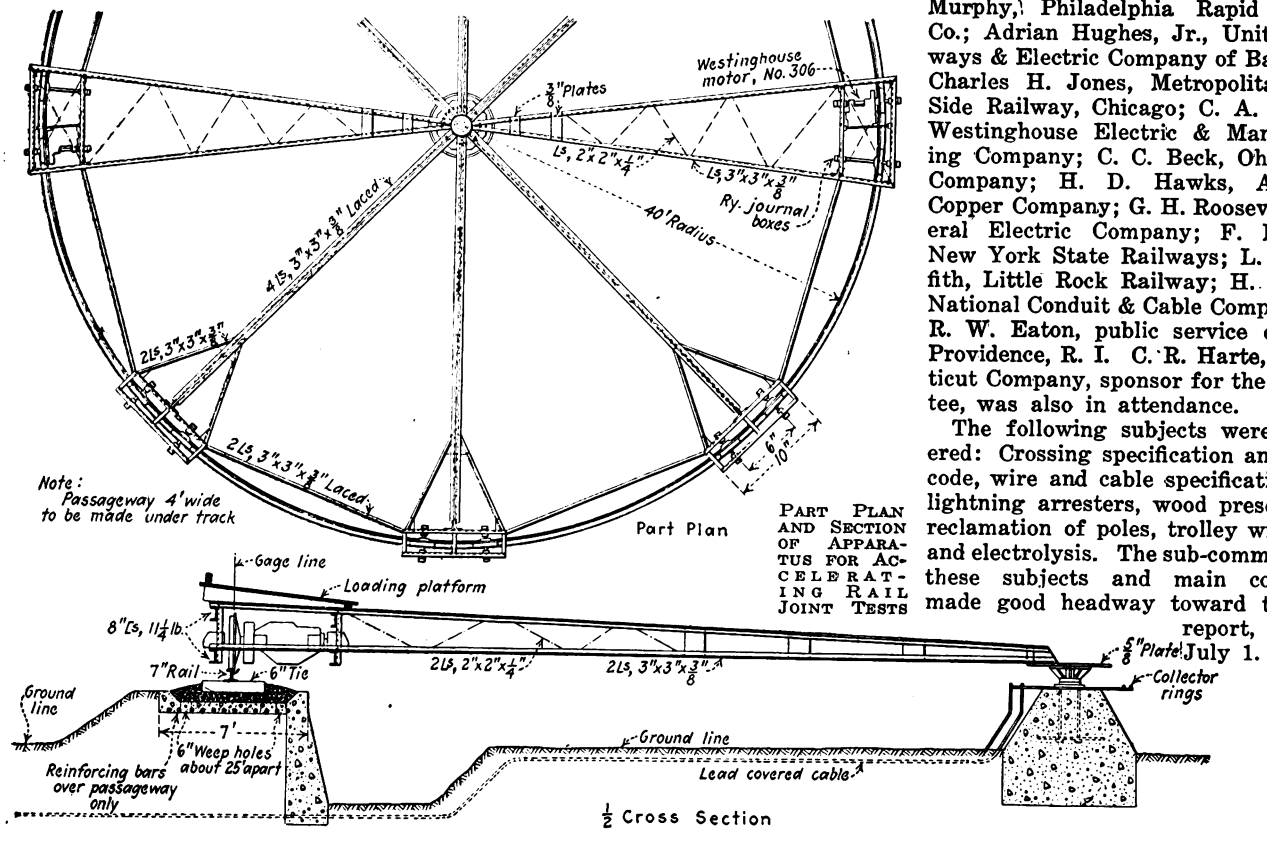
Joint Testing Machine Proposed

A MEETING of the way committee of the American Electric Railway Engineering Association was held in Quebec at the time of the convention of the Canadian Electric Railway Association. It was well attended and a statement will appear later as to the principal conclusions reached. In this issue, however, it is possible to give some particulars of a proposed machine for testing rail joints suggested at the last meeting of the committee by W. W. Wysor, chief engineer of the United Railways & Electric Company of Baltimore and also proposed at the meeting of the committee on welded rail joints which is functioning under the auspices of the American Bureau of Welding. This machine is proposed for subjecting joints to accelerated tests, by passing wheel loads over them in very rapid succession.

In its tentative form the machine consists of a circular monorail track about 80 ft. in diameter, spiked to short wood ties laid on ballast, in turn supported on a substantial concrete foundation which is reinforced where it passes over passageways, mentioned later. The joints to be tested would be those in this monorail. Running on this circular rail it is proposed to have a number of two-axle trucks, say eight, carried at the end of the arms of a wheel-like structure, light in weight, but stiffly braced to insure a tangent relation between the wheel flanges and the rail.

While details of drive are, like other portions of the design, still under discussion, it has been suggested that this be furnished by two railway motors, located at opposite ends of one diameter, the structure being enlarged along this diameter to provide for the motor mounting. Current for these motors would be led to the structure through a pair of collector rings, averaging say 5 ft. in diameter. To provide for loading the axles to such a point as to duplicate operating conditions, a platform would be mounted over each truck for the accommodation of weights.

A simple pivot bearing with wearing plates would be sufficient support at the center of the structure, because the principal weight will be carried by the trucks and the wheel flanges will insure the proper relation of the frame to the circular rail. A passageway 4 ft. wide will give access under the track to the inside.



PART PLAN AND SECTION OF APPARATUS FOR ACCELERATING RAIL JOINT TESTS

Committee on Entertainment

THE committee in charge of the entertainment at the October convention has been appointed and will hold its first meeting in Chicago on June 23, in the office of its chairman, J. V. Sullivan, assistant to the president Chicago Surface Lines, Berland Building. The members of the committee, in addition to Mr. Sullivan, are:

W. H. Beatty, Jr., sales representative Westinghouse Traction Brake Company; J. W. Porter, first vice-president Electric Service Supplies Company; G. T. Seely, vice-president Pennsylvania-Ohio Electric Company; N. G. Symonds, district manager Westinghouse Electric & Manufacturing Company; J. R. Blackhall, general manager Chicago & Joliet Electric Railway; H. J. Kenfield, president Kenfield-Davis Publishing Company; John Benham, vice-president International Register Company; H. L. Monroe, district manager General Electric Company; Harry L. Brown, Western editor ELECTRIC RAILWAY JOURNAL; Martin Schreiber, manager southern division and chief engineer Public Service Railway; E. F. Wickwire, secretary Ohio Brass Company; Thomas Finigan, vice-president American Brake Shoe & Foundry Company; J. H. Alexander, vice-president Cleveland Railway, and E. E. Kretschmer, purchasing agent Chicago & Interurban Traction Co.

Power Distribution

THE meeting of the committee on power distribution of the Engineering Association was held in New York on June 6. Those of the committee in attendance were M. B. Rosevear, chairman, Public Service Railway; F. J. White, the Okonite Company; H. S. Murphy, Philadelphia Rapid Transit Co.; Adrian Hughes, Jr., United Railways & Electric Company of Baltimore; Charles H. Jones, Metropolitan West Side Railway, Chicago; C. A. Butcher, Westinghouse Electric & Manufacturing Company; C. C. Beck, Ohio Brass Company; H. D. Hawks, Anaconda Copper Company; G. H. Roosevelt, General Electric Company; F. McVittie, New York State Railways; L. F. Griffith, Little Rock Railway; H. S. Burd, National Conduit & Cable Company, and R. W. Eaton, public service engineer, Providence, R. I. C. R. Harte, Connecticut Company, sponsor for the committee, was also in attendance.

The following subjects were considered: Crossing specification and safety code, wire and cable specifications, d.c. lightning arresters, wood preservation, reclamation of poles, trolley wire wear and electrolysis. The sub-committees on these subjects and main committee made good headway toward the final report, expected July 1.

Bacharach Hearing Concluded

Home Rule Measure Criticised Severely by Utility Commissioners—Bill Not Likely to Pass

A majority of the members of the committee on the judiciary of the House of Representatives are believed to be opposed to the Bacharach bill. This measure proposes to limit the jurisdiction of the United States district and circuit courts in the matter of granting injunctions from decisions by state and municipal public utilities commissions. The hearings on the bill were closed on June 9, when the opposition completed its presentation of testimony.

Bill Not Likely to Be Legislation of the House

It is understood in well informed legislative circles in Washington that the subcommittee will probably report that the bill will be unconstitutional if enacted and the policy aimed at which would deprive the Federal courts of the right of injunction to prevent property losses pending judicial determination of the validity of orders issued by the state boards would in any effect be bad policy on the part of the government. Owing to the congested state of legislation on the calendars of Congress and the near approach of the periods of recess for the House, it is stated in Washington that it is not probable that the Bacharach bill will be made a part of the program of legislation to be considered at present. Abstracts of recent testimony follow:

Paul P. Haynes, Indianapolis, representing the Interstate Public Service Company of Indiana, appeared in opposition to the bill. Mr. Haynes, formerly a member of the Public Service Commission of Indiana, declared that the men who have had longest experience and who are qualified to present the best thought on the matter are conclusively against the bill. On the other hand, he expressed the opinion that the real intent of the principal proponents of the legislation is to strike down state regulation of public service companies so as to return to home-rule.

In answering Mayor Hylan's contention that the state courts acted more promptly than the United States courts, Mr. Haynes cited numerous examples to prove that the federal courts act with more expedition and declared that this is self-evident to all lawyers. With regard to the situation in Kansas, Mr. Haynes stated that there are many instances in which the Public Service Commission has refused to increase the rate when it had been proved that it was justified. He said that the United States judge in that district had stated time and time again in open court that the Public Service Commission of Kansas has failed wholly to do its duty under the law.

A statement by Carl D. Jackson, chairman of the Public Service Commission of Wisconsin, and president of the National Association of Railway & Utilities Commissioners, was introduced into the record, in which he declared that public utilities boards and commissions should welcome judicial review and interpretation. A letter from J. W. McCardle, chairman of the Public Service Commission of Indiana, was presented to the judiciary committee. In this communication Mr. McCardle said:

> Not only is the Bacharach bill a vicious one from the standpoint of its specific provisions, but it is the character of legislation which, if approved, will break down the constitutional bulwarks which have stood for more than a century and will lead to interminable chaos.
>
> As chairman of the Public Service Commission of Indiana, I desire to say frankly that the Indiana Commission invites a review of its decision by the Federal district courts just as freely as by state courts. If the acts of the Public Service Commission of Indiana are unconstitutional, this fact should be determined as speedily as possible.

The bill also was opposed by Patrick J. Lucey, formerly Attorney General of Illinois. He declared there is no real public demand for this legislation. There is a demand for it, he said, "on the part of certain gentlemen who capitalized the weaknesses of the people. They are seeking this legislation for the purpose of talking for it. It has brought a support to the bill which has given it a bad standing."

Testifies States' Rights Not Involved

Frank S. Carden, representing the Tennessee Power Company, declared in the course of his testimony before the committee that the question involved is not one of states' rights. To pass the measure, he said, meant to deprive citizens of the use of federal courts when their federal rights are involved. He called attention to the fact that while the Tennessee Public Utility Commission had been listed as supporting the bill, the commission itself had telegraphed the judiciary committee that it is not supporting the bill.

Mrs. May Lavelle McDermott, president of the Civic League of New York, appeared for the bill. Among other things, she said:

> We believe in states' rights and home-rule. The utilities should exhaust their remedies in the state courts before they go to the United States Supreme Court. Such corporations have no property rights as such for they only have the privilege granted by the state authorities. Therefore, only the State should have the power to regulate these corporations.

$2,049,597 Accounting Sought

Expert for City Seeks Detailed Accounting for This Sum in Valuation and Rate Case

Delos F. Wilcox has reported to the city of Minneapolis, Minn., upon the expenditures of the Twin City Rapid Transit Company for the period of twenty-two years from 1900 to 1921. As Mr. Wilcox himself explains, the purpose of the report is to account for the sum of approximately $2,049,597 accruing to the Twin City Rapid Transit Company from the earnings of its subsidiary companies during the twenty-two years in excess of the amounts paid out by the company in the form of dividends to its preferred and common stockholders during that period.

Mr. Wilcox reports that the total of money taken by the company from the earnings of the subsidiary companies, 1900 to 1922, is $27,158,977. There was paid out in dividends on preferred and common stock during the same period $25,109,380. This leaves the sum of $2,049,597, the disposition of which Mr. Wilcox is at pains to explain. His report contains details of the entries taken from the books of the company. The question which he asks is, "What has a company alleged to be a mere holding company done with this large amount of money not used in the payment of dividends?"

He regards the books and records of the holding company just as pertinent to the valuation and the rate proceeding now in progress as if the entries appeared in the books and records of the Minneapolis Railway itself.

As a final justification for the inquiry into the books of the holding company Mr. Wilcox makes a statement which is true only in so far as it is susceptible to proof. He says:

> If the Twin City Rapid Transit Company, taking advantage of its absolute and arbitrary power over the activities of the subsidiary companies and of its chosen sole, or financial godmother, spends the surplus in part in foolish ways or in ways inimical to the public interest, instead of paying them out to its own security holders or holding them in it own surplus account, obviously it impairs its own credit and thereby strangles the credit of the subsidiary companies, which can act only through or by the grace of the Twin City company in raising funds for extensions and improvements.

The capital stock of the company is $25,000,000. According to Mr. Wilcox it represents about $10,000,000 of cash paid in. The common stock reached a 5 per cent dividend basis in 1903 and 6 per cent in 1910. In 1918 it dropped to 2 per cent. The dividend paid in 1919 was 2½ per cent, in 1920 3 per cent and in 1921 2 per cent.

Mr. Wilcox has divided his statements of earnings and expenses of the company into three periods—1900 to 1906, 1907 to 1913 and 1914 to 1921. In

Digitized by Google

the period from 1900 to 1906 receipts and disbursements, or dividends, were equal to $6,769,700. This is explained, so Mr. Wilcox points out, by the fact that the company carried no surplus account of its own, all of its expenditures being charged as expenses of the subsidiary companies. From 1907 to 1913 the receipts from subsidiaries were $9,862,775 and the dividends $9,359,250, leaving $503,525. In the period from 1914 to 1921 the receipts from subsidiaries were $10,526,501 and the dividends paid $8,980,430, leaving a balance of $1,546,071.

On June 10, the day that the Wilcox report appeared, Horace Lowry, president of the company, said:

We have thrown open to the inspection of Dr. Wilcox and his assistants all of the minutes and account books of all of the companies comprising the Twin City system, and this is all we can do. Dr. Wilcox has intimated that about $2,000,000 of the moneys received by the Twin City Rapid Transit Company from its various subsidiaries has been improperly expended, and this the company emphatically denies.

It is obvious to any thinking person that the various necessary expenditures of the Twin City Rapid Transit Company made from its own funds and not charged to the Minneapolis and St. Paul street railway companies have no bearing whatever on the value of the properties of the Minneapolis company.

The attack on the company apparently is a move to create prejudice just prior to the coming primary election. We are satisfied to rest our case on the books themselves, which are open to Dr. Wilcox, and we will aid by turning over to him all records in our possession, as we have already done in the case of all records he has asked for.

Later he commented as follows:

I have carefully gone over Dr. Wilcox's report on the accounts of the Twin City Rapid Transit Company and after doing so I can see little to add to the statement I made earlier today.

The report deals with the expenses of the holding company, which does not own or operate the Minneapolis Street Railway, and I cannot see that any of these expenses have any bearing on the present proceedings before the Minnesota Railroad & Warehouse Commission. The law provides that the commission shall determine the value of the property of the Minneapolis Street Railway and determine what should be the proper charge for carrying passengers to yield a fair return on said value when determined.

The report of Dr. Wilcox deals with various expenditures of the Twin City Rapid Transit Company over a period of fifteen years and includes all of the holding companies' expenses including taxes, legal expenses, bond discounts, traffic surveys, valuation expenses, officers' salaries and expenses and other items of corporate expense.

All of these matters do not affect the issue of the rate of fare as all of that hinges on the value of the property to be determined, and the report is one which is entirely irrelevant.

The reason for this statement is that all of the money in the treasury of the Twin City Rapid Transit Company is the result of dividends paid to it by the Minneapolis Street Railway, and other companies whose stock it owns, and the fact that the Twin City Rap'd Transit Company paid these expenses has helped the underling companies, as many of these expenses could have been properly charged to the operating company.

City Takes Railway Property

Montevideo, S. A., has taken possession of the electric railway line as a result of a fortnight's strike in which the men demanded more pay from the European companies operating the lines. The city refused to permit an increased rate of fare. The government in a statement said that a settlement could be brought about by the companies paying higher wages but no heavier tariffs would be allowed.

Arbitration Board Cuts Wages Five per Cent

A wage reduction of 5.45 per cent for motormen and conductors employed by the Connecticut Company on all its lines was announced at New Haven, Conn., on June 12 by the arbitration board which has had the subject under consideration. The maximum rate as ordered is cut from 55 to 52 cents an hour. The intermediate rate is fixed at 48 cents and the minimum at 45 cents. The scale for operators of the one-man cars is set at 7 cents an hour above the regular two-man cars. The wages of other employees affected by the arbitration board are reduced 5½ per cent.

The award is signed by Justice John K. Beach of the State Supreme Court and Joseph F. Berry, Hartford, Conn., representing the company on the arbitration board. James H. Vahey, Boston, Mass., representing the men, did not sign the award. He gave out a dissenting opinion in which he said he did not believe the basis used by the arbitrators in rendering their decision on wages was a correct one. After pointing out that he agreed with Justice Beach a year ago in a similar award Attorney Vahey says:

His idea is that last year's award took up the lag in wages created by the increase in the cost of living in 1918-19-20. If last year Justice Beach corrected the irregularities then existing, we ought reasonably to assume that June 1, 1921, was a fair starting point to fix the wages for 1922.

Agreement Reached in New York State

Trolleymen in Rochester, Syracuse and Utica have voted to accept the contract offered to them by James F. Hamilton, president of the New York State Railways, according to an announcement made by John H. Reardon of the general executive board of the street car men. The vote was light in all three cities, according to union officials, indicating a general acceptance of the company's proposition. The agreement provides for the same working conditions which prevailed under the contract that expired on May 1.

By the new terms motormen and conductors of the three cities were given a cut of 3 cents, making the new wage scale 46, 48 and 50 cents an hour, as against 49, 51 and 53 cents last year.

Separate contracts to be drawn in the three cities will provide for joint negotiations. Mechanical men will receive a cut of 2½ cents an hour, which will make the new scale 50 cents an hour.

Employees of the Canandaigua line will receive 45, 48 and 50 cents an hour as against 58 under the old contract, a cut of 8 cents.

On the Rochester and Sodus Bay line the men will receive a maximum scale of 52 cents against 55 cents last year.

On the Rochester and Eastern line the rate will be 52 cents as against 55 cents last year.

Men on the Clinton line out of Utica will receive 52 cents against 55 last year.

On the Oneida line the scale will be 55½ cents against 58 last year.

The situation in Schenectady is to be considered separately and will probably be taken up at an early date. Here the men are working under the terms of the agreement which has lapsed and are now receiving 60 cents an hour, almost 25 per cent more than the minimum wage under the new scale for the other cities.

The Schenectady men are demanding an increase for operators of one-man trolley cars.

New Scale on Philadelphia Rapid Transit Lines

The official statement of the Philadelphia (Pa.) Rapid Transit Company on the new schedule of wages which was referred to briefly in a previous issue of the ELECTRIC RAILWAY JOURNAL is as follows:

The co-operative plan for collective bargaining of the Philadelphia Rapid Transit Company provides as a basis for determining wages the average of the wage scales of the street railway companies in Chicago, Detroit, Cleveland and Buffalo. In conformity with the wage decrease of the Cleveland Railway Company the general committees under the co-operative plan agree as follows:

That the scale of wages of the trainmen of the Philadelphia Rapid Transit Company, effective June 1, 1922, be as follows:

	Rates per Hour—New Men, Cents	After Three Months, Cents	After One Year, Cents
Surface motormen and conductors (operators—one-man cars, 5 cents additional...	57½	60½	62½
Elevated motormen...	60½	63½	65½
Elevated conductors..	57½	60½	62½
Elevated guards.....	57½	59½	60½

That the wage scale of the regular hourly rate employees of the way department be reduced 1 cent per hour, effective June 1, 1922; that the wage scale of the hourly rate employees of the shop and building divisions in the rolling stock and buildings department be reduced 1 cent per hour, effective June 1, 1922.

Other employees are not affected by the Cleveland Railway adjustment.

Will Electrify Sixty-four Miles of Railway

Negotiations for the electrification of approximately sixty-four miles of track now operated by the Missouri Pacific and Union Pacific Railroads in central Kansas are being completed between George Theiss, Jr., president of the Arkansas Valley Interurban Railway, and the heads of the two steam lines involved. This track consists of 30 miles of Missouri Pacific line between Newton, Kan., and McPherson, and 34 miles between McPherson and Salina on the Union Pacific line. Only minor details are yet to be arranged, and electrification is expected to be complete by Jan. 1, 1923, according to plans of the electric railway company. It is planned to operate several passenger cars and at least one freight car daily between Newton and Salina. The new lines will make interurban electric railway connections of practically 94 miles from Wichita to Salina, or 99 miles from Hutchison to Salina.

Employees Told How to Sell Service

The Eastern Massachusetts Street Railway, Boston, Mass., has adopted a somewhat unique method to improve its service. Through one of its public directors, Fred J. Crowley, and its publicity manager, Fred A. Cummings, it arranged for meetings of its employees for a frank discussion of its relation to the public. At these meetings the officers told the men that they should consider themselves as salesmen who are selling to the public the only commodity that the company has to sell—"service"—and in order to compete with the jitneys and automobiles they would have to make the service so attractive that the public would take it. This they could accomplish by being courteous and amiable and running their cars on time, so that the customers would come to depend upon the service.

On one of the divisions, the cars as a rule would run off schedule, mostly late, until the people were in a habit of thinking of the cars as operating without any fixed schedule. When Mr. Crowley and Mr. Cummings took the matter up with the employees in that division they were informed that it was useless to try to operate the cars on the schedules that were posted; it could not be done. The men were told that if that was the message they wanted to send to the trustees of the company it would be delivered, but with the definite understanding that if these men could not "sell" the service their places would be filled within thirty days by other "salesmen." Then a week of earnest effort followed and now the cars are being operated on time.

In connection with this "salesmanship" campaign, which has just ended, the company has installed headway recorders along the routes to register the progress of the cars. It is as important that a car should adhere to a schedule along the route as it is that it should start on time, for every point is a starting point for some passenger, and the schedule is disturbed if the car lags behind at first and then speeds up so as to reach the terminal on time. By means of a contactor on the trolley wire the car registers in a clock-box when it passes that point. It is just like punching a time clock, and is found to be particularly useful in recording the operation of cars at the midway points.

Passes Ordinance Providing Rules for Public Utilities

The City Commissioners of Galveston, Tex., recently passed an ordinance establishing rules and regulations governing public utilities occupying the streets of the city, engaged in furnishing and selling electric light and power to the city, and in the operation of street railways. The ordinance provides for the creation of a depreciation reserve fund which shall be kept as a distinct fund and shall not be paid out in dividends nor for any other purpose than that for which it was created. The ordinance also sets up machinery for investigating and determining the reasonableness of rates and fares, and for changing such rates and fares when deemed advisable.

Wage Scale Renewed

Men and Management at Davenport Succeed in Arranging Settlement Mutually Satisfactory

Possibility of a strike and tie-up of all surface line transportation in the tri-cities in the face of the National Grotto convention at Davenport, Ia., June 25-28, was removed on June 12 when the union operatives agreed to a year's contract by which the present wage scale is kept in force.

The scale is 51, 53, 55 cents an hour and will apply to both the Tri-city Railway of Iowa and Illinois lines. Practically all of the men are operators of more than a year's service, so the current wage will be 55 cents.

In opening negotiations the men asked for 67 cents an hour. They also demanded a joint contract and recognition of their international union. The company proposed a scale of 43 cents an hour and separate contracts with the workmen of the respective lines, with no recognition of the union.

The one-man car question did not come up, the men being apparently satisfied with all one-man car operation, which has been in force throughout the tri-cities for several months.

After negotiations extending more than a month the men came down to 60 cents an hour, a figure which the company refused to meet. The company, however, offered 50 cents. The men in mass meeting refused the 50-cent offer.

Arbitration was then suggested, but the railway demanded arbitration in terms of the municipal charters and the men insisting on arbitration in terms of the agreement of the past year. The company officials pointed out that this agreement had in the meantime expired.

In this situation the men presented an ultimatum to the company backed by a strike vote demanding acceptance of the operators' terms within forty-eight hours.

Peace soon followed this strike vote, taken on Sunday, June 4. The union negotiators agreed to present a 55-cent wage offer to their men, under three separate contracts, but recognition of the Amalgamated Association implied. Following approval of this offer by the executive council of the union it was submitted to a vote of the union membership and carried.

For the three separate companies the negotiations were conducted by R. J. Smith, general manager of the Tri-City Railway of Iowa; T. C. Roderick, general manager of the Tri-City Railway of Illinois, and Clark G. Anderson, general manager of the Clinton, Davenport & Muscatine Railway. The contracts are signed with the interurban men and with Division 312 and Division 313 of the international.

Association Seeks to Lower Street Car "Overhead" Costs of Operation

The California Real Estate Association in opening up its drive for an initiative amendment to the State Constitution to relieve the electric railway lines of the State from unfair operating charges, through its secretary has stated that the California electric railway lines are now bankrupt and unable to make needed extensions of service. The 36 systems of the state are, with one or two exceptions, insolvent and have never paid dividends on common stock. They are compelled to pave, light, repair, sweep and sprinkle the streets along which they operate, and these charges prevent them from breaking even. The proposed amendment will give the State Railroad Commission the power to grant franchises. In the opinion of the association the present burdensome conditions of franchises will be eliminated if the amendment is accepted.

Special Transportation Commission Considered

A bill has recently been introduced in Massachusetts for the formation of a special commission to study transportation. This commission is to consist of the chairman of the Public Utilities Commission, the commissioner of Public Works, the commissioner of the Metropolitan District Commission, and two citizens, residents of the Metropolitan Parks district. The members are to be appointed by the Governor and are to be known as the Metropolitan Transportation Commission. This commission is to investigate the transportation service and facilities within the Metropolitan Parks district and such other cities and towns as may be later on determined. The purpose is to co-ordinate the service upon the highways, waterways, railroads and street railways, and to see what, if any, use of existing facilities of carriers of one or more of such methods can and should be made by others. The commission is also to determine the best manner of effecting such co-relationship and what improvements and new facilities should be provided for a conscientious and co-ordinated development of transportation in the district, as well as the relation of such service to the general service rendered by all highways, waterways, railroads and street railways in the state. The bill has been reported upon favorably by the committee on street railways.

New Line Planned.—Following its becoming a city on April 13 Long Beach, N. Y., will have a transit line to replace the present bus service and will connect directly with the Long Island Railroad station and the new automobile bridge. The Mayor recently announced the routing of a gasoline-operated line over 80 lb. rails to be laid in Park Street through the business and residential districts to the Lido Golf Club.

Financial and Corporate

Twelve Large Companies Compared

Operating Ratio Goes Down for Surface Lines and Up Slightly for Rapid Transit

For several years past the ELECTRIC RAILWAY JOURNAL has presented statistics showing the trend of business on six of the largest surface lines and an equal number of rapid transit properties. It has been of special interest to compare these figures with the results of the electric railway industry as a whole, such as published in this paper for April 29, 1922, page 729, which included an analysis of 103 city properties. While these 103 companies produced gross earnings of $368,000,000, the twelve city properties under consideration here showed total earnings of $318,000,000 and they operated one-ninth of the electric railway track mileage in the United States.

While six of the companies are classed as rapid transit, only three operate elevated or subway lines exclusively, the other three being a combination with surface lines. Each of the twelve companies collected more than $8,000,000 in the last fiscal year and their average receipts exceeded $26,000,000. The prevailing rates of fare varied, three charging 5 cents, two 5 cents with a 2-cent transfer charge, one 6 cents with a 1-cent transfer charge, three 7 cents, one 8 cents and two 10 cents, with a lower ticket rate in some cases.

Gross earnings of the six surface properties showed a gain of 4.5 per cent over the previous year, while operating expenses, including taxes, increased only 0.8 per cent. For the rapid transit companies these increases were 4.5 and 5.4 per cent, respectively. The operating ratio for the surface group averaged 85.08 per cent, as against 87.45 in the previous year, and ranged from 77.09 to 97.96 per cent. The average for the rapid transit group was 77.92 per cent, ranging from 62.88 to 93.51, compared with an average of 77.26 in the preceding twelve months. Taking the three roads which operate only subways or elevated lines the operating ratios averaged 75.9, as against 73.8 in the previous year. The total passengers per mile of single track operated showed a decrease of 9.2 per cent for surface companies and 5 per cent for rapid transit lines. The number of passengers in the former group ranged from 912,110 to 1,928,941 and in the latter from 1,149,928 to 1,472,795. It must be noted, however, that several companies, particularly in the latter class, do not keep track of transfer or free passengers and for that reason the figures shown are low.

Less service was rendered by each car in the past year on surface lines, the annual miles operated per car averaging 35,862, as against 36,565 in the preceding year. On rapid transit lines there was an increase, the figures being 38,557 this year and 38,440 last. Revenue passengers on surface lines decreased 4.1 per cent, but the car mileage was reduced only 1.7 per cent. On rapid transit lines the number of passengers was practically unchanged and there was only a slight reduction in service. The average of car-miles per car-hour on surface lines was not changed from the previous year, while on rapid transit lines there was a decrease of 1.7 per cent. This item used to be considered an index of speed performance, but in recent years car-hours have been so augmented by contract requirements that it no longer is regarded as of much value.

In the above figures, as in the ones given in the table herewith, it must be remembered that five of the companies have a fiscal year ending June 30 while the others more nearly correspond to the calendar year.

The comparison corresponding to this for last year may be found in the ELECTRIC RAILWAY JOURNAL for June 4 1921, page 1053.

STATISTICS PER CAR-MILE AND PER CAR-HOUR, AVERAGE ON TWELVE LARGE ROADS

	Six Surface Roads			Six Rapid Transit		
	1919	1920	1921	1919	1920	1921
Transportation revenue per car-mile	38.9c	44.7c	47.8c	33.1c	38.0c	40.7c
Expenses and taxes per car-mile	32.5c	37.6c	43.2c	25.9c	30.6c	33.4c
Transportation revenue per car-hour	$3.26	$4.00	$4.03	$4.21	$4.63	$5.21
Expenses and taxes per car-hour	$2.75	$3.37	$3.62	$3.25	$3.70	$4.13
Operating ratio, per cent	83.06	87.45	85.08	74.00	77.26	77.92

Discontinuance of Service Refused

The Public Utilities Commission at Hartford, Conn., has denied the petition of the Connecticut Company for permission to discontinue the interurban trolley lines which serve the cities of Rockville and Hartford, the line for a greater part of the way running over the steam tracks of the New Haven road. The commission ruled that there was need for interurban service, occasioned by the existing inadequacy and insufficiency of the street railway facilities, and also that there was lack of evidence showing that interurban service was non-profitable. This is the second attempt on the part of the Connecticut Company to discontinue this service.

New Property Acquired

Middle West Utilities Company Takes Over the Eastern Wisconsin Electric Company

The Middle West Utilities Company, Chicago, Ill., announces that it has acquired the Eastern Wisconsin Electric Company, which is now serving fifteen communities and one or more public utility services, among which are the cities of Sheboygan and Fond du Lac.

The Eastern Wisconsin Electric Company also furnishes local electric railway service to the cities of Sheboygan, Fond du Lac and Oshkosh and operates interurban electric railways leading out of these three cities. The total population served is estimated at 110,000 and the gross annual revenue of the company exceeds $1,500,000.

Announcement is also made that the Wisconsin Power, Light & Heat Company will undertake to construct a 66,000-volt high tension transmission line extending from Dane through Columbus and Beaver Dam to Fond du Lac, a distance of 75 miles. This line will interconnect the Eastern Wisconsin Electric Company's properties with the subsidiary properties of the Northwest Utilities Company, which is a subsidiary of the Middle West Utilities Company.

The directors of the Middle West Utilities Company have declared a dividend of $1 on the preferred stock of the company, payable on July 15 to stockholders of record June 30. The action taken by the board provides for the payment of the accrued dividend for the three months ended March 15, 1922.

Dividends are being paid in ten-week intervals, instead of three months, and it is the policy to continue this until all accrued dividends have been paid, the fixed dividend payments in the meantime being continued. Under the plan there will be five dividend payments this year.

At a meeting of the directors of the Eastern Wisconsin Electric Company the board was reorganized as follows: Martin J. Insull, Britton I. Budd, M. F. La Croix, R. H. Ellis, G. C. Neff, W. C. Sharp, and Marshall E. Sampsell. The officers elected are as follows: Marshall E. Sampsell, president; Martin J. Insull, vice-president; Douglas Shaw, treasurer; Leroy J. Clark, secretary and assistant treasurer; and J. C. Neff, assistant secretary.

Ten Months' Statement Submitted

The Interborough Rapid Transit Company, New York, N. Y., finished the ten months ended April 30, 1922, with a net corporate deficit of $2,398,091 against $3,807,850 for the corresponding ten months a year ago. Operating revenue was $44,515,525 compared with $45,914,051 for the ten months ended April, 1921. Operating expenses were $26,880,834 against $30,210,327. There was a falling off in the number of revenue passengers which amounted to 19,168,634.

Commission Denies Abandonment Application

The Railroad Commission of Wisconsin has dismissed the petition of the Bay Shore Street Railway, Green Bay, Wis., to permit the applicant to surrender its indeterminate permits, to cease operating its railroad thereunder, to take up and dispose of its property in the streets and highways and to go out of the street railway business. The commission holds that it is without authority to authorize the surrender of the permits or the taking up and disposal of the property and that the evidence does not justify an order permitting the cessation of operation. The Bay Shore Street Railway owns a line located in part in the city of Green Bay and in part in the town of Preble, about 1§ miles in length, and leading to a bay shore park known as Bay Beach. The line has been operated during the summer months only and up to the past year has been operated by the Wisconsin Public Service Company under contract with the Bay Shore Street Railway. During the summer of 1921 the line was leased by the city of Green Bay and operated under a contract between the city and the Wisconsin Public Service Company.

The company has outstanding 6 per cent bonds to the amount of $15,000, held by A. W. Priest of Appleton, and also outstanding stock to the amount of $11,500, which is also held by Mr. Priest as collateral for a personal loan of like amount to the president of the company.

During the summer of 1921 the contract with the city called for the payment of $1,580 rental for the property plus the taxes, which amounted to $211. The city then contracted with the Wisconsin Public Service Company for the operation of the line. The service was arranged on a transfer basis with the Wisconsin Public Service Company's lines so that the regular fare was charged. It is estimated that during the season 80,000 persons visited the Bay Beach Park.

The commission found that irrespective of whether the property can be made to earn on its capitalization, it will be of greater value as a going concern than it would be if abandoned as contemplated. The commission was unable to see that there would be any advantage to the owners of the property to abandon and any justification of the abandonment of a system that "renders what appears to be a service much needed in the community."

Boston Climbs Steadily

The reserve fund of the Boston (Mass.) Elevated Railway created under Public Control Act now totals $1,171,866.60. In July, 1922, all of this reserve fund in excess of the $1,000,000 required by law will be repaid to the cities and towns that contributed to the loan assessment which made up the deficit of $3,980,151 assessed in 1919. The efforts of the company are now directed toward the repayment to the municipalities of a substantial amount in July.

The reserve fund was exhausted in 1918 and fully restored in April, 1922. May, 1922, will be the first month in the entire three years and ten months of public operation that receipts will exceed cost of service and at the same time the reserve fund be intact.

Liverpool Doing Better

The report of the general manager for the Liverpool Corporation Tramways for the year 1921 gives the following figures for revenue and expenditure: Total revenue, £1,558,907; operating costs (including rentals of leased lines), £1,300,785; gross profit, £258,122; interest, £46,650; surplus for year, £156,685. The total revenue given is an increase of £105,006 over 1920, although there was a decrease in the two years in passengers carried of 47,989,531 or from 220,219,091 to 172,-229,560. This reduction in traffic is attributed, however, largely to the present depression in trade and the coal dispute, and it is believed that when the conditions of trade improve the record of 1920 will at least be reached. The passengers carried in 1921 are an increase of 19½ per cent over 1913, which was the last full year of operation under pre-war conditions.

There have been three increases in fares during the past 2½ years. During 1921, as compared with 1920, there was an increase in wages. The motor omnibuses which were introduced in 1919 and 1920 to assist the depleted cars to carry the vast numbers of passengers have been withdrawn from the routes on which they were originally installed and now operate only to connect up the outlying suburbs.

Financial Results of Railway Operation in California

Recent reports to the California Railroad Commission show that out of eleven properties six finished the year 1921 with a net corporate loss. The statement of earnings in the accompanying table includes railway operation in Stockton, Visalia, Santa Cruz, Bakersfield, Fresno, Lodi, Sacramento, Oakland, Glendale, Calistoga, Ortega and San Jose for 1921.

Court Affirms Right to Tax on Gross Receipts

The New Jersey Supreme Court, in an opinion by Justice Trenchard, has upheld the constitutionality of the act passed by the Legislature in 1919 providing for the taxation of gross receipts of utility companies. The case was brought before the reviewing tribunal by the Salem & Pennsgrove Traction Company, operating in Salem County. That company held it was taxed $4,806.22 under this law which it claimed was invalid. Justice Trenchard states that the 1919 law was in the form of a license tax and not a tax on property. The company, in its argument, contended that the act is a violation of the state constitution in that it attempts to tax personal property other than on its true value.

Speaking on the contention of the utility company that the tax authorized by the act is not a franchise tax, but a property tax, the court said:

> We find nothing in the act to sustain this contention. The act discloses a legislative intent to substitute in place of the personal property tax an additional franchise tax, based upon gross receipts for use of the street.

The court said the Legislature is within its province when it exempts certain classes of corporations from personal property taxation and treats them as separate classes.

Defunct Property Sold

The rolling stock, franchises and equipment of the defunct Monmouth County Electric Company, which for many years operated between Long Branch and Red Bank, N. J., and between the latter place and Rumson, were sold in separate parcels at auction on May 31. There was a score or more of purchasers, but no bidders for the property as a whole. The total receipts were $33,000. The road was built twenty-five years ago at a cost of $1,000,000. It went into the receiver's hands six years ago, and last March, because of jitney competition, ceased operations. If the sale is confirmed the tracks will be taken up within the next thirty days and the poles and wires removed. The Atlantic Coast Electric Railway bought the company's rolling stock, the prices ranging from $100 to $500 per car.

CALIFORNIA RAILWAY OPERATION IN 1921

	Operating Revenue	Operating Expenses	Net Operating Revenue	Interest, Rent, Taxes, etc.	Net Corporate Income or Loss	Surplus or Deficit at Beginning of Year	Accumulated Surplus or Deficit at End of Year
Stockton Electric R.R.	$346,596	$283,925	$62,671	$29,672	$37,602	$317,204	$354,835

Participating Preferred Stock Proposed

The directors of United Light & Railways Company, Grand Rapids, Mich., have approved plans to increase the capital stock of the company from the total present authorized amount of $30,000,000 to a total authorized amount of $50,000,000, to be composed of 500,000 shares of $100 each.

The entire authorized increase of $20,000,000 par value will be classified and known as participating preferred stock. Of this authorized amount, approximately $3,500,000, par value, will be issued on or about July 1, 1922, being sufficient for the conversion of one-half of the present outstanding common stock, share for share. This stock will draw dividends at the rate of 7 per cent annually and be payable in quarterly instalments. The 7 per cent dividend will be cumulative.

A further dividend to the extent of 1 per cent additional shall be declared on the participating preferred stock whenever in any year the common stock of the company shall pay or have declared thereon dividends of 7 per cent or more. The participating preferred stock will be subordinate to the first preferred stock, now outstanding, in its claim on assets and earnings of the company. The participating preferred stock can be called for redemption, in whole or in part, on any dividend date, at the option of the company at 120 per cent of the par amount and all accrued and unpaid dividends thereon.

A special meeting of the stockholders of the company is called to be held at Portland, Maine, on June 30, 1922, to ratify the act of the board of directors and to approve the increase in the authorized capital stock and the classification of it into participating preferred stock.

Canadian Discount Lower, So Railway's Troubles Diminish

Now that the discount on Canadian money has decreased to 2 per cent, the troubles of the Calais (Me.) Street Railway have proportionately decreased. In the days of the war when the discount on Canadian money was as high as 18 per cent, the company placed a discount on Canadian money, although it serves Canadian as well as American territory. The line operates in the Maine towns of Calais and Milltown, and the New Brunswick towns of St. Stephen and Milltown, all four towns being opposite each other on the St. Croix River, which is the boundary line. When the Calais Street Railway placed a discount on Canadian money there were many and vigorous protests from Canadian patrons. But the company was not swerved from its purpose, stating it would lose heavily should no discount be ordered. The headquarters of the company is in Calais, where the Canadian money was not worth par value.

After the war, the discount on the Canadian money started to decrease until a year ago it was 6 per cent. Now it is but 2 per cent and fluctuating lower—usually between 1 and 2 per cent. The company is now taking Canadian money at face value.

Surplus in St. Louis Decreased

The United Railways, St. Louis, Mo., which has been operating under a receivership since April 12, 1919, has reported a net income of $303,045 for the year ended Dec. 31, 1921. This figure represents a decrease of $780,383 over the net income for the year 1920. The consolidated balance sheet as of Dec. 31, last, shows cash amounting to $361,093; and total assets and liabilities of $110,243,240. The condensed income account for 1921 compared with 1920 is as follows:

	1921	1920
Gross operating revenue	$19,658,551	$20,267,729
Operating expenses and depreciation	15,093,219	15,274,806
Net earnings	$4,565,332	$4,992,923
Taxes	1,675,697	1,437,337
Income from operation	$2,889,635	$3,555,586
Other income	216,350	145,856
Gross income	$3,105,985	$3,701,442
Deductions	2,802,940	2,618,014
Surplus	$303,045	$1,083,428

Old Property Ceases to Exist—Merger Effected

The West End Street Railway, Boston, Mass., passed out of existence on June 10, under legislation of 1911 allowing the merger of this company with the Boston Elevated Railway, which has controlled it by a lease since Oct. 1, 1897. The West End company was formed in 1889, and a year later it secured the controlling interest in all the street railway lines then operated in Boston and suburbs, including the Metropolitan, the Highland, the Cambridge, the Middlesex and the South Boston companies, the prime mover in the consolidation being Henry M. Whitney. At that time there were 10,000 horses in the service in Boston, and two years later electrification of the roads began.

In 1897 the West End company was leased to the Boston Elevated under a proposition to build an elevated structure in Boston for rapid transit and placing this rapid transit line and the existing surface lines under the same management. At that time the yearly income from street railway service in Boston was $9,000,000 and today it is $30,000,000; the number of revenue passengers was 181,000,000 and today this is 350,000,000. The entire system is operated today by public trustees, with Edward Dana as general manager.

Under the consolidation that terminates the West End Street Railway its stock becomes first and second preferred stock of the Boston Elevated Railway, maintaining the same relative position that it held under the lease.

West Penn Purchases Traction Lines

The West Penn Traction & Water Power Company, Pittsburgh, Pa., made an offer on May 5 to the holders of the common stock of the Monongahela Power & Railway Company for the purchase of their holdings, the offer being contingent upon the delivery of a sufficient amount of the common stock of the Monongahela Power & Railway Company to vest control of the latter company in the West Penn Traction & Water Power Company. It was provided that delivery of the stock should be made at a depository in New York. Information is at hand that more than enough of the stock has been deposited in accordance with the offer to assure the consummation of the deal.

The operation of the Monongahela Power & Railway Company will be continued as heretofore, with general offices in Fairmont, W. Va. It is planned at an early date to connect the power transmission lines of the Monongahela Power & Railway Company with those of the West Penn interests and, as soon as sufficiently substantial interconnections can be made, to operate the two electric power systems in common.

Prior to making this offer the West Penn System had been extended southward into West Virginia by the purchase through the West Virginia and Maryland Power Company, one of the subsidiaries of the West Penn Railways Company, of the electric plants at Grafton, Kingwood, and Elkins, W. Va. The territory served by these properties lies contiguous to that of the Monongahela Power & Railway Company and plans are now being made to consolidate electrically these properties and intervening territory in one power transmission system.

Advantage of Readjustment Plan Emphasized

The protective committee, headed by Grayson M. P. Murphy, representing the Interborough-Metropolitan 4½ per cent bonds, issued a statement recently pointing out the advantage that will accrue to holders of these bonds through their exercising the first of the three options under the Interborough Rapid Transit Company and Manhattan Railway readjustment plan. The period within which holders of the 4½s may deposit them under the plan of readjustment expired on June 14 last, and the period within which holders of certificates of deposit may excerise their election to purchase new Interborough ten-year 6-per cent gold notes under the plan expired on the same date.

The Interborough-Metropolitan 4½ per cent bonds are an issue of the old holding company and are secured by the deposit of stock of the Interborough Rapid Transit Company as collateral. Under the readjustment the Interborough-Metropolitan 4½s will pass out of existence.

Traffic and Transportation

Ordinance Passed

Jitney Regulatory Ordinance in Richmond Signed—Six-Cent Fare Question to Be Decided

The Common Council of Richmond, Va., on June 5 concurred in the action of the Board of Aldermen by passing the new jitney regulating ordinance and the Mayor signed it on June 8. The ordinance will become effective on June 24.

The ordinance provides five routes, over which 515 jitneys may operate. These routes take care of demands in South Richmond, Church Hill, Fulton and the "fan" district in the West End. The South Richmond routes cover practically the same territory over which the jitneys now operate.

The "fan" route begins at Ninth and Grace Streets, to Belvidere, to Franklin, to Lombardy, to Hanover, to the Boulevard, to Grove, to Park, to Laurel, to Franklin, to Ninth, to Grace, the point of beginning.

The only deviation from the routes is that permitted at Addison Street, when west-going automobiles may, when loaded, turn at that point, and return downtown. Other deviations may be made on emergencies, when streets may be blocked, or when the Director of Public Safety may determine that the public good may be conserved, such as periods during the State Fair.

No jitney operator may under the ordinance, when using "extended routes," charge more than 25 cents for any one fare. The regular fares fixed by the ordinance are: For the "fan" district, 8 cents; all other routes, 10 cents, except that school children cannot be charged more than 7 cents. Children under 5 years of age are to ride free.

The number of jitneys designated for each route are: "Fan" district, 200; Hull Street, 100; Semmes Avenue, ninety; Church Hill, seventy-five; Fulton and Fulton Hill, fifty.

Each person operating a jitney must procure liability insurance policies in the sum of $5,000 for injuries to one person; $10,000 for two or more persons, and $1,000 for property damages, and must procure license tax receipts of $25 for cars seating five passengers; $35 for cars seating seven passengers, and $50 for eight passengers and over.

The ordinance has also been adopted providing for the advertisement of a continuance of the 6-cent fare on the lines of the Virginia Railway & Power Company. This measure will go before the Mayor within a few days. After he has placed his signature thereon it will be published for ten days and then must be passed on by the joint body of Council and Aldermen.

The existing ordinance providing for the 6-cent fare expires by limitation on July 16. The proposed ordinance extends that right for three months, it being expected that by that time the experts inquiring into the condition of the company will have completed their report upon which a fair basis for charges may be predicated.

Seven-Cent Fare Assured With Formal Injunction Against Six-Cent Rate

The 7-cent fare, with three tickets for 20 cents, became effective on the Chicago Surface Lines on June 15. This was made certain with the formal entry of an injunction order against the 6-cent fare by Judges Evans and Page in the United States District Court on June 9. This was done after Attorneys Sheean and Weber for the companies had accepted the 7-cent arrangement as a condition for having the 6-cent order restrained, the judges having explained that they had no authority to fix rates. The court stated that no determination of the value of rebate slips would be made until after the report of the master prior to the entry of a final order. A significant statement made by Judge Page was to the effect that if it is finally determined that the 6-cent rate would be confiscatory the company could immediately begin charging 8 cents because it has accepted the 7-cent rate under special conditions.

Several conferences have been held between President Henry A. Blair and the union representatives with a view to revising the present contract which calls for a maximum wage of 80 cents. It has been rumored that a 20 per cent reduction is contemplated, effective July 2. When the companies are ready to make an offer the men will vote on the proposition. It has been rumored that a strike will follow any attempted reduction, but the union officials said they had given out no such statements. It is hoped that a peaceable settlement can be made.

Council Reinstates Seven-Cent Fare

As a result of the costly experiment of the 5-cent fare the City Council of Brandon, Manitoba, ordered the Brandon Municipal Railway to return to the 7-cent fare or four tickets for 25 cents. The higher fare had been established last year but on March 1, 1922, the 5-cent fare was re-established for a try-out of three months. The experiment decreased the revenue $1,636 in that period against the revenue in 1921. The Council unhesitatingly ordered the return of the higher fare after it had reviewed the company's statement.

Reduced Fare Plan in Prospect

Newly Elected Mayor of Seattle Working on Fare Problem—Five-Cent Fare Ordinance Introduced

Mayor Edwin J. Brown, who was recently elected, has announced that within ninety days he will have a tangible plan to offer to the Council for the reduction of fares on the Seattle Municipal Railway to 5 cents, the pre-war rate. One of Mayor Brown's most earnest campaign pledges was that if elected he would immediately set about the reduction of fares in Seattle, and he has already attacked the problem and is preparing a plan that will be presented within the time that is stipulated above.

No Rush Measures to Be Taken

In the meantime, a 5-cent fare ordinance has been introduced in the City Council by Councilman C. B. Fitzgerald, carrying a provision that a 5-cent fare shall become effective on Aug. 1, 1922. The ordinance was referred to the city utilities and finance committees. Mayor Brown said that no rush measures were to be taken on this important matter.

The ordinance provides for a 5-cent fare on all lines of the municipal railway within the city limits, with a 2-cent charge for transfers. Certain cross-town and short-haul lines are exempted from the transfer charge. An additional charge of 5 cents would be made to passengers riding beyond the city limits on the city's Lake Burien line. Mr. Fitzgerald introduced the ordinance in order that there might be some basis on which to work toward fare reduction, he states.

Mr. Brown took office on June 1. In his inaugural address, he intimated that any reduction in fare must necessarily come through revision of the contract of purchase with the Stone & Webster interests. The retiring Mayor, Hugh M. Caldwell, said:

> We have contracted to operate the railway at a profit of $833,000, and to turn that sum over to Stone & Webster every year. In 1921, on the 8¼ cent fare, we just about broke even, counting only $20,000 for depreciation. You may jolly yourself into believing that more people will ride at a 5-cent fare, but you must remember that the more people who ride, the greater the expense. You must also remember that the courts have ruled that the fares cannot be reduced at the expense of the taxpayers nor at the expense of the bondholders. I ask you, in the name of common sense, at whose expense are you going to reduce fares? There remain but two ways of reducing fares: reduce wages and service or force a rewriting of the contract of purchase.

Advocates Renewal of Private Jitney Service

Mayor Caldwell said further that reducing wages and service would not be sufficient to make a 5-cent fare possible, and that nothing remained but to revise the contract, "to squeeze out more than $7,000,000 of water in the price the city is paying for the system." He also advocated renewal of private jitney service as a means of forcing Stone & Webster to revise the contract.

Fare Fight Up Again

Unless Dallas Railway Promises to Expend $450,000 in Improvements 5-Cent Fare Will Be Ordered

The fare controversy between the Dallas (Tex.) Railway and city officials of Dallas, which appeared to have been settled some time ago, has again cropped up with the result that the matter may find its way into the Federal Courts unless some agreement is reached soon. The extension of one year for the 6-cent fare privilege will expire on June 27, and at that time the City Commission must act on the proposal to grant a further extension or compel the traction company to revert to operation under a 5-cent fare.

Mayor Aldredge, seemingly backed by members of the City Commission, has proposed that the Dallas Railway raise $450,000 to be spent for betterments and improvements within the next twelve months, and has taken the stand that unless the company raises or pledges this sum before June 28, the 5-cent fare will be ordered effective on and after that date. The Mayor has announced definitely that the city will not consider indefinite extension of the 6-cent fare privilege, and will grant no extension whatever except in return for pledges in regard to improvements.

Officials of the company have replied to Mayor Aldredge's proposal with the declaration that unless the city grants an extension of the 6-cent fare at the time of its expiration on June 27, the company will go into Federal Court and seek an injunction restraining the enforcement of the 5-cent fare and will then make a fight for a 7-cent fare on the ground that any less fare will be confiscatory and inadequate to produce fair returns on the invested capital.

The city is demanding extensions on five lines, new paving on three others and the taking over of two short lines owned by other interests.

In discussing the city's demands for improvements, which will cost $450,000, Judge W. M. Holland, president of the Dallas Railway, explained that the traction company had on hand for improvements only $111,000, the sum recently returned by the stockholders to whom it had been paid as past-due dividends under the 7 per cent earning provision of the franchise. It would be necessary for the company to borrow the other $340,000, he said, and this would be impossible with the present low earnings and impaired credit of the company. It would be impossible to borrow, he said, even with the 6-cent fare.

Examination of Railway's Books in Progress

Frank C. Perkins, the Socialist commissioner of public affairs of Buffalo, N. Y., is meeting with opposition as a result of his efforts to bring about a return of the 5-cent fare on the local lines of the International Railway in Buffalo. Corporation Counsel William S. Rann has advised the City Council to wait until the Public Service Commission audits the books of the International before it adopts the recommendation of Commissioner Perkins, and other members of the City Council are inclined to agree with him.

The municipal authorities now have an application before the state utilities board to set aside the 7-cent fare. As part of that proceeding the commission has granted permission for an examination of the books of the railway company. This examination is now in progress. At the time the 7-cent fare became effective, it was done on the assumed valuation of the company's city properties at $18,000,000. The company now claims a valuation of $40,000,000.

Another Pass in Effect

As a means of stimulating riding and to overcome jitney competition, the Stark Electric Company, Alliance, Ohio, has adopted the plan of issuing a weekly pass for $1. The scheme went into effect on June 4. H. W. Witherspoon, general manager of the company, plans to test the idea out for a period of four weeks.

A 7-cent fare or sixteen tickets for a dollar had been the rate charged by the company, but receipts have been constantly dwindling.

Recently the fare on the buses was cut from 6 cents a ride to 5 cents or twenty-five tickets for a dollar. The railway then countered with the $1 weekly pass, good for any member of a family.

The reduction in fare by the railway has been met with another reduction by the J. B. Cox Bus Company, which operates the city buses. That company has issued a pass for which it charges 75 cents. This may also be used by any member of a family as often as desired.

Indiana Roads to Reduce Rates

An average reduction of 10 per cent in the freight rates on interurban lines running into the city of Fort Wayne, Ind., will probably go into effect within the month, with the Indiana Service Corporation taking the lead. This is the announcement made by S. W. Greenland, general manager.

Revised tariff schedules are now being prepared as ordered by a recent ruling of the Interstate Commerce Commission for steam railroads and permission is now being sought from the Public Service Commission to enable the local interurban interests to file the revised rates on one day's notice.

Fort Wayne shippers having freight consignments for Lafayette, Bluffton and Lima will benefit by the cut as these are the lines under the direct control of the Indiana Service Corporation. Interurban freight rates have always been lower than steam roads and the proposed reduction will correspond to the cut the steam roads are to make on July 1, by order of the Interstate Commerce Commission.

Litigation Over Fare in Little Rock Ends

Difficulties between the city of Little Rock, Ark., and the Little Rock Railway & Electric Company were ended recently when an order was entered in the United States District Court dismissing the case of the railway versus the city in regard to an ordinance prohibiting a change in fares. The company had asked for a temporary injunction to prohibit the city from enforcing an ordinance repealing one of May, 1920, permitting a 6-cent fare.

By the terms of the original ordinance, the company was permitted to increase the fare from 5 to 6 cents, the increase to be effective for one year from the date of passage. Upon the expiration of the period named an ordinance was passed by the City Council repealing the increased fare ordinance. An order for a temporary injunction was sought by the railway to prevent the enforcement of the ordinance

The Council, however, took steps recently to repeal the second ordinance, thereby removing the cause of the litigation. Judge Trieber's order has dismissed the case at the cost of the railway company.

Galveston Attorney Objects to Items Charged to Operating Expenses

Controversy between the City Commission of Galveston, Tex., and the Galveston Electric Company over fixing fares in Galveston appears imminent and there is no indication that the issues may be adjusted soon. In the statement by officials of the traction company recently submitted to the commission showing the company's operating expenses, several items were objected to by City Attorney Anderson and it was then declared that such items could not be properly included in the operating expenses for fare-making purposes.

The company claims the present 5-cent fare is confiscatory and is petitioning the City Commission for authority to increase the fare. C. L. Sayre of the firm of Ernst & Ernst, public accountants of Houston, has been employed to make an audit of the company's books and report on the company's operating expenses and earnings. Mr. Sayre's report will cover the fiscal year of 1921 and the first three months of the present fiscal year.

It developed at a hearing before the City Commission that the item of federal income taxes is being included as operating expenses. City Attorney Anderson declared such items were disallowed by the court in its former action. Mr. Anderson also called attention to the fact that the present report showed $115,607 for maintenance, whereas the court heretofore held $70,000 annually as adequate for maintenance. An item of $11,036 under the head of rate litigation was also objected to, Mr. Anderson asserting it had been thrown out by the court.

Personal Mention

Railway President Addresses Rotarians

Preston S. Arkwright, president of the Georgia Railway & Power Company, Atlanta, Ga., addressed the International Convention of Rotary Clubs at Los Angeles, Cal., on June 8, 1922. He declared that the specter of governmental control, destroying initiative and enterprise, restricting usefulness, and in the end killing private ownership and operation, will hover over private and corporate enterprise until service is made the basis of all business.

Mr. Arkwright's subject was "Business—The Rotarians' Opportunity to Serve Society." His appeal was for a broadening of the interest of every business man, looking toward the general end of complete understanding and the resultant fairness that must be the rule in all business dealings.

"Abuses of business," he declared, "must be corrected by the men engaged in business themselves. Failure to do this will result inevitably in correction of these abuses by compulsion through governmental restrictions. Governmental interference," he pointed out, "is the paramount threat to the business world of America today."

In support of his contention he cited the history of the American railroads in recent years. "Regulation once begun became progressively more restrictive. The rates of the railroads were fixed, their earnings limited, their services specified, their operating conditions prescribed, the wages of the employees prescribed. Duties and responsibilities were imposed upon them, while the opportunity to meet the increased difficulties through enterprise, initiative and business management was taken away. As an inevitable consequence, expansion and improvement of railroads ceased, service deteriorated, operation became more expensive, freight and passenger rates became higher and the whole country with all its industries and all its business is suffering from want of railroads in new territory, from the abandonment and taking up of railroads already built, from inadequate and insufficient equipment and from high rates and charges. A repetition of the history of the railroads is occurring in the public utilities, in the meat packing and coal industries. The same peril extends to all other lines of privately conducted business.

In concluding, Mr. Arkwright pointed out the duty of the business man not to center his entire interests on his own particular affairs. He said that no matter how sound and intelligent the practice of one concern in a particular line may be, if a considerable number of others in the same industry engage in unfair practices, all who are engaged in the industry are going to suffer too.

R. J. Irvine Leads Southern Club

President of Company in Jackson, Tex., Elected Head of Southwestern Electrical and Gas Association

Below the Mason-Dixon line lives Ralph J. Irvine, newly elected president of the Southwestern Electrical and Gas Association. From Jacksonville, Tex., where he is president of the Jacksonville Light & Ice Company, Mr. Irvine will broadcast his strengthening policies and carry on the important work of the association.

To follow Mr. Irvine's career means to deal with a vital period of development in the history of many important electric plants in Missouri and Texas. For Mr. Irvine's work has been extensive; he has whipped his work in shape in short order and passed on to the next job in line. When one can do that one can soon have a creditably extensive career.

R. J. IRVINE

It was in 1900, as superintendent of the construction department for the Marshall Light, Heat & Power Company, Marshall, Mo., that Mr. Irvine stepped into the public utility field, but his engineering experience quickly won for him the position as chief engineer. In 1906 he was appointed president and general manager of the National Light, Heat & Power Company, which purchased the property of the Marshall Light, Heat & Power Company and the Marshall Gas Company.

After five years with this enlarged company, Mr. Irvine became vice-president and general manager of the Moberly Light & Power Company, which means to those allowed behind the scenes that he reconstructed the electric and gas plants of the Moberly company. With that accomplished, and with the company well on its successful way, Mr. Irvine was transferred by the Inter-State Electric Corporation in 1915 to San Angelo, Tex., as vice-president and general manager of the San Angelo Water, Light & Power Company. But that position is not all he held at that time, for he was simultaneously president of the Winters Light & Power Company and the Ballinger Light & Power Company, and was in control of the operation and construction of the Inter-State Electric Corporation's West Texas interests.

Mr. Irvine and his associates purchased the franchise and assets of the Jacksonville Electric & Ice Company in 1921, after leasing the property during 1920 from the Commonwealth Light & Power Company. This property was destroyed by fire in that year, and since the purchase of the company by Mr. Irvine it has been reconstructed with a 600-kw. electric generating station and electrically driven ice plant.

As president of the Southwestern Electrical and Gas Association Mr. Irvine is continuing a type of work in which he has had previous experience, for in 1911 he was elected president of the Missouri Electric, Gas and Street Railway Association.

E. J. McIlraith Advanced

E. J. McIlraith, recently appointed superintendent of rolling stock and buildings of the Philadelphia (Pa.) Rapid Transit Company, has been with that company since 1919. His first work was in the elevated-subway division. In 1920 he was made operating manager of the division, and in less than a year he was again promoted, becoming superintendent of way. In April of this year he was advanced to the head of the department of rolling stock and buildings. After his graduation from the University of North Dakota, where he received the M. E. degree, Mr. McIlraith spent three years at Cornell as instructor and graduate student in Sibley College. For some time thereafter he was engaged in construction work, and in various branches of city engineering work. For several years before joining the Philadelphia Rapid Transit Company, he was associated with Stone & Webster in Seattle, becoming superintendent of way in 1913. Mr. McIlraith is succeeding R. T. Senter, now special assistant to the president.

Mr. Crone Directs Bureau

Fred W. Crone has been appointed director of the recently organized New York State Committee on Public Utility Information. The bureau will disseminate information in regard to the gas and the electric light and power industries in the Empire State. The electric railways are not at present included in the plan under which the committee in charge will operate. Mr. Crone was a reporter and editorial writer on the New York *Tribune* for fifteen years. For the last three or four years he has been engaged in general publicity work.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Contract Given for Railway Electrification

The Harbor Commission of Vancouver, B.C., has let a contract for the electrification of three miles of railway track on its industrial section in the heart of Vancouver known as Granville Island, to W. W. Fraser, electrical contractor, Vancouver, the cost being $12,000. It is proposed to turn over the tracks when electrified to the British Columbia Electric Railway for operation. Some alterations to the tracks will be required to permit the use of electric locomotives. Granville Island is connected with the British Columbia Electric system but has hitherto been operated by a steam locomotive.

Extension of Electric Railways in London Planned

It is reported that an extensive improvement program is proposed for the extension of electric railways in London, England. The extension of the underground railways is estimated to cost in the neighborhood of £6,000,000. Proposed electrification of parts of the South Eastern & Chatham and London, Brighton & South Coast Railways should make total expenditures of £20,000,000.

G.E. Elects Two New Vice-Presidents

John G. Barry, sales manager of the General Electric Company since 1917, and manager of its railway department for many years, and A. H. Jackson of the law department, were recently elected vice-presidents of the company at a meeting of the board of directors.

Mr. Barry has been connected with the General Electric and Thomson-Houston companies for thirty-two years and is fifty-two years old. He was first employed in the production department of the Thomson-Houston Company in Lynn, in 1890. A year later he was transferred to the construction department of the Boston office and in 1894 entered the railway department at Schenectady, following the organization of the General Electric Company.

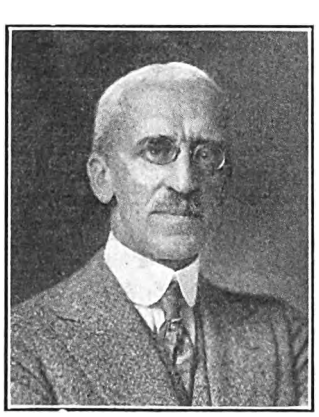
Mr. Barry worked up to the position of assistant manager of this department in three years, and in 1907 was appointed manager, in which position he exerted a marked influence on many aspects of the company's sales problems and policies. His success as manager of the railway department, at that time, and still, one of the most important divisions of the G.E. organization, led to his appointment in 1917 as general sales manager and his present promotion to vice-president.

J. G. BARRY

Mr. Barry is a member of the executive committee of the American Electric Railway Association, being one of the representatives in that committee of the manufacturing members. He is also one of the three members of the association's committee on finance and has always taken a great interest in the affairs of the association.

Mr. Jackson has been head of the law department of the General Electric Company for several years. He was born in Schenectady in 1864 and was educated in the public schools there. In 1886 he was graduated from Union College, and two years later received the degree of LL.B. from the Albany Law School. Mr. Jackson first practiced law with his father, Judge Samuel W. Jackson, and remained with him until 1902, except for three years with the firm of Chanler, Maxwell & Philip in New York.

Mr. Jackson was first employed by the General Electric Company in the law department in December, 1902. He is a member of the University Club of New York, and the Mohawk Club and the Mohawk Golf Club of Schenectady.



A. H. JACKSON

Department of Commerce and Industrial Marketing

Bureaus at Work on Simplifying Practice—How Manufacturers Can Reduce Waste

Speaking at the first National Industrial Advertising Conference of the Associated Advertising Clubs of the World in Milwaukee, on the subject, "What the U. S. Department of Commerce Is Doing to Aid Inter-Industrial Marketing," F. M. Feiker, vice-president of the McGraw-Hill Company, Inc., and formerly personal assistant to the Secretary of Commerce, Herbert Hoover, said, this week:

"Advertising can bring government and business together, because advertising brings business and the public together, and the government's relation to business is after all simply the public's relation to business. Mr. Hoover believes that industry should police itself, and the Department of Commerce has provided an organization through which industry can work in policing itself in constructive measures.

"The Bureau of Census is being developed as a great fact-finding organization for industry, to which individual industries may contribute their information, and from which each industry will receive in return a comprehensive, collective picture of the trend in business and the basic facts as to production, stocks, volume of sales, which get at the heart of intensive merchandising.

"The Bureau of Foreign and Domestic Commerce similarly has been reorganized to become a great medium for the interchange of information and the promotion of our foreign trade. Over 150 foreign trade committees from different associations are working through fifteen or twenty special commodity experts of the Department of Commerce in the extension of foreign trade in different fields of activity, and as a result of this helpful service to industry the inquiries from business men per day at the Department of Commerce have jumped from two or three hundred to over one thousand.

"In a third of the seven great divisions of the Department of Commerce, the Bureau of Standards, a fundamental step has been taken in the elimination of waste in industry, both in production and distribution, by the establishment of a Division of Simplified Practice. This Division of Simplified Practice does not tell industry what it must do to be saved, but reverses the operation and acts as a center point to which committees of industry representing all branches, buyers and sellers and specifiers, may come to discuss the opportunity for the simplification of dimensions and the elimination of excess varieties.

"After less than a year's work this division of the department has already concrete evidence of accomplishment. The paving brick manufacturers have reduced the number of paving bricks by mutual consent between themselves

Digitized by Google

and their buyers from sixty-six to five. The lumber manufacturers are discussing the opportunity for simplified nomenclature of lumber and deciding what the size of, for example, a 2 x 4 should be, and a lot of other sensible things.

"The whole program for a better understanding of statistics in industry, the advancement of our foreign trade and its long-time and vital relation to our domestic trade, the elimination of millions of dollars of industrial waste through simplified practice, all are full of copy ideas for advertising both in the field of industrial advertising and in the field of general advertising. If twenty of our largest advertisers would approach their business from the point of view of eliminating waste along the line of simplifying sizes and eliminating excess varieties and then advertise their programs of simplification to the buying public, one of the greatest forces for public education and more intelligent buying would be started. And more intelligent buying will make possible more regular production and cut out seasonal variation.

"It is comparatively easy to get a good idea. It is perfectly simple for a new administration to come into government with a completely new conception of its relation to industry. It is another thing to have industry understand this point of view just as it is another thing to have a great new idea quickly percolate through industry.

"Our national machine for the assimilation of ideas at best is a clumsy one. We have the trade association with its convention. We have the lunch table conference between three or four men. Certain men in public life become at times the unconscious parents of good ideas and help sell them to industry. We have the daily press and the general press, and we have also the great virile force for the education of industry, the industrial press, through whose editorial and advertising pages it is possible to reach in detail groups and classes of men with regard to their particular problems. Most of our advertising up to the present has been built upon some trade situation rather than on some fundamental economic situation. We may not turn all our advertising at once into economic advertising, but we may base all advertising at once on fundamentally sound economics."

Metal, Coal and Material Prices

Metals—New York	June 13, 1922
Copper, electrolytic, cents per lb.	13.812
Copper wire base, cents per lb.	14.75
Lead, cents per lb.	5.75
Zinc, cents per lb.	5.775
Tin, Straits, cents per lb.	31.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$6.375
Somerset mine run, Boston, net tons	3.25
Pittsburgh, mine run, Pittsburgh, net tons	....
Franklin, Ill., screenings, Chicago, net tons	...
Central, Ill., screenings, Chicago, net tons	..
Kansas screenings, Kansas City, net tons	2.85

Weatherproof wire base, N. Y., cents per lb.	15.50
Cement, Chicago net prices, without bags	$2.07
Linseed oil, (5-bbl. lots), N. Y., cents per gal.	87.00
White lead, (100-lb. keg), N. Y., cents per lb.	12.25
Turpentine (bbl. lots), N.Y., cents per gal.	95.00

Large Electrical Shipment

What is said to have been the largest single consignment of electrical apparatus for railroad electrification ever made was shipped this week from the works of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. It represents the first consignment of equipment for the electrification of the Chilean State Railways and consisted of thirty-two cars. Altogether the train was about 1,300 ft. long. The shipment included two complete substation equipments. The thirty-nine locomotives which are included in the order will be shipped later. The shipment will go from East Pittsburgh to the docks of the Baldwin Locomotive Works at Philadelphia, Pa., where it will be loaded on shipboard.

Rolling Stock

Pensacola (Fla.) Electric Company, through Receiver Holtzclaw, has announced that arrangements have been made for buying eight new safety appliance cars for service on the East Hill loop and plans are for the delivery of the cars by Aug. 1.

Virginia Railway & Power Company, Richmond, Va., placed an order on June 10 with J. G. Brill Company for twenty-five new standard safety cars for operation on the lines in Richmond. They will cost approximately $150,000. They have been promised for delivery in about two months' time.

Southern Indiana Gas & Electric Company, Evansville, Ind., on June 3 suffered the destruction by fire of the Water Street carhouse. Included in the equipment totally or partially destroyed were six large double-truck cars, seven single-truck cars and three twelve-bench open cars. Four other cars were slightly damaged. The loss is covered by insurance.

Track and Roadway

Wichita Falls (Tex.) Traction Company has received the approbation of the City Council for the building of a line to serve North Wichita Falls.

Morris County Traction Company, Morristown, N. J., will lay double tracks and roadbed in Madison road in place of the single track. The double track will extend from Sussex Avenue to Cutler Street.

Arkansas Valley Interurban Railway, Wichita, Kan., is starting the installation of about a quarter mile of spur track connecting the line with a rock salt mine which is owned by George Theiss, Jr., president of the railway, and Emerson Carey, salt magnate of Hutchinson.

Springfield (Mass.) Street Railway, through President Clark V. Wood, has declared its purpose to petition for a location of tracks on the Vernon Street and Wight Place loop, in the event that the plan to widen Vernon Street to 80 ft. is adopted by the city. This would take the place of the Court Square loop, petition for which was recently refused by the City Council.

Dayton & Western Traction Company, Dayton, Ohio, has made surveys for the new location of the tracks in New Lebanon. The change will move the tracks several hundred ft. outside of the corporation line and will require a minimum removal of 650 ft. at the closest point. This has been demanded by the village of New Lebanon.

Calais (Me.) Street Railway, according to a proposal, may be extended to Woodland, which is 12 miles up the St. Croix River from Calais. At present Woodland is connected with Calais by a branch line of the Maine Central Railroad, with but two trains per day each way, and also a bus service. Eastport, which is on the coast and 30 miles by road from Calais and St. Stephen, is also desirous for an extension of the trolley line.

Trade Notes

National Advertisers will hold an exhibition on the Million Dollar Pier, Atlantic City, Sept. 8 to 15 inclusive. This exhibition will have as its object the boosting of American industry.

Hardwood Lumber Manufacturers will have a convention at the Henry Watterson Hotel, Louisville, Ky., June 15, 16 and 17. Ways will be considered for providing proper inspection so as to guarantee the quality of lumber and simplify lumber dimensions where possible.

Metal & Thermit Corporation announces that during the first five months of 1922 a total of 8,694 Thermit insert rail joints have been purchased and installed by electric railways. Of these 2,000 were purchased by the Osaka Railway Company of Japan, 1,400 by the Pittsburgh Railways, and 1,200 by the Milwaukee Electric Railway. The remaining 4,094 were distributed among ten other electric railways.

New Advertising Literature

Ohmer Fare Register Company, Dayton, Ohio, has issued a booklet entitled "A Fare Saved." This describes the collecting of fare on an electric railway where Ohmer registers are used.

Drew Electric & Manufacturing Company, Cleveland, Ohio, has published a leaflet describing its protective and reclaiming pole sleeves. These are for use in reclaiming trolley or transmission poles of either wood or steel.

Combustion Engineering Corporation, New York, N. Y., has republished a booklet relative to the powdered coal installation at the River Rouge plant of the Ford Motor Company. This reprint contains some additional information not previously included on operating results at this plant, which has been in operation slightly over a year.

Eliminate the Waste in Railway Service

ALL those who have been following closely the work of the Department of Commerce must become impressed with the emphasis being laid by the department upon the desirability of waste elimination in American industry. Of course, Secretary Hoover's name had become identified with the elimination of waste long before he entered the Department of Commerce. As food controller he urged upon the nation during the war the principle of the "clean plate." Later, as chairman of the Federated Engineering Societies, he initiated the investigation into waste in industry as exemplified in ten key industries, the results of this inquiry being published later in book form. One of the most interesting exhibits at the annual meeting of the Chamber of Commerce of the United States in Washington, D. C., was that of the Commerce Department, showing how efforts were being made to induce various manufacturers to reduce the number of varieties and styles of articles made by them.

The same points have recently been brought out in a number of recent addresses by Secretary Hoover. Thus, during the last week in May, he urged upon the National Lumber Manufacturers' Association the desirability of the standardization of grades, qualities and markings of lumber and the simplification of dimensions and other items that make for economy in production, transportation, distribution, etc., of lumber. Again, in an address to the National Electric Light Association on May 19 he spoke about the benefits which might be secured in the reduction of waste in industry through electric power distribution because of the replacement of a large number of small steam units as well as much manual labor. "The more general spread of electric power," he continued, "is inevitable for this reason if for no other."

The elimination of waste is, after all, the foundation of economical operation in all industry, including the electric railway industry. Even the most able managers admit that much can be done on their properties to obtain more efficient service. If this is true where much time and thought are given to the subject, it must be doubly true on the less efficient properties.

A good starting point is in the matter of speed of cars. Here a study could be made of the time taken for stops to receive and discharge passengers, as well as the causes for all other stops, so as to bring the time of both down to the minimum. Excessive car mileage is another cause of loss. The judicious use of turnbacks is one way by which this source of waste can be brought under control. Another common loss is in poor schedules, resulting in uneven spacing of cars, and waste seat-miles. The schedule maker should constantly study the possibilities in service reduction where cuts can be made without materially discouraging traffic.

Transportation wastes only have so far been discussed, but there are equal opportunities for good work in other departments of most properties. These include the power, shop, accounting, claims and executive departments. An individual and a nation can be thrifty without being parsimonious; so a company can avoid waste without driving away any patronage.

Standardization of Tie Sizes Should Be Encouraged

ELECTRIC railway companies should follow with considerable interest the work of the sectional committee for the standardization of cross ties of the American Engineering Standards Committee, which held its first meeting on June 2 in the rooms of the American Society for Testing Materials at Philadelphia. This committee is composed of representatives of the American Railway Engineering Association, American Electric Railway Engineering Association, American Society of Civil Engineers, American Society for Testing Materials, National Association of Railroad Tie Producers, National Hardwood Lumber Association, National Lumber Manufacturers' Association, United States Department of Commerce, American Wood Preservers' Association, Society of American Foresters, American Mining Congress and the United States Forest Service, so that all the industries most vitally concerned are represented.

At the present time almost every purchaser of ties has his own pet specification, the difference between many of these being so slight as to make no possible practical difference one way or the other. This is known to be true of electric railway properties. Analysis of the situation in the electric railway field shows, for example, that nearly 86 per cent of the total mileage use ties 6 in. in depth and about 77 per cent use ties 8 in. in width. The remainder specify depths and widths greater or less than these. Over 64 per cent of the roads operating standard gage track use ties 8 ft. in length, the remaining 36 per cent specifying lengths varying from 6 ft. 8 in. to 8 ft. 10 in. There may be sufficient reason why one-third of the electric railway companies cannot use ties 8 ft. in length and why 20 per cent cannot use ties cut under a 6-in. x 8-in. specification, but it is difficult to believe that the slight differences in dimensions which now exist in the different specifications will produce any practical difference in the results obtained from the ties in service over those which would be obtained from ties cut under a 6-in. x 8-in. x 8-ft. specification.

The result of this multiplicity of the specifications for railway ties is that it is impossible for the tie producers to cut ties in advance of receiving an order, and then only sufficient to fill that order. Assuming a limited number of standards of ties in use, ties could be cut when other work is slack, orders could be

Digitized by Google

anticipated, producers could stock up to a certain extent with a quantity of the different classes of standard ties with the assurance that these ties would meet the requirements of every road for the particular class tie in question, and the result would not only be more prompt delivery to the consumer but a reduction in cost as well.

The sectional committee is using the standard specifications of the A. R. E. A. as a basis for the formulation of a standard specification to cover all requirements for standard gage track. A number of changes are under consideration in the attempt to harmonize the differences of opinion among the committee members and it is hoped that an early agreement will be reached in order that the industry may have the full benefit of the efforts of this committee.

Proposed Investment in Rail-Joint Research Promises Big Returns

THE committee on welded rail joints, which was organized under the auspices of the American Bureau of Welding, is planning to lay a scientific basis for conclusions as to the merits of particular joints and practices. As the rail joint committee, through interlocking membership, is closely allied to the committee on way matters of the Engineering Association, its work may be considered virtually as a part of the activities of the latter. It is highly proper, therefore, that the electric railway industry should furnish financial and moral support to the work of the rail joint committee. The industry will be the chief beneficiary of the results of its researches.

The committee will presumably soon be in the market for funds, a modest sum compared with the savings which should result from the tests which are proposed to be made. Roughly speaking, the total amount asked will be about three-thousandths of 1 per cent of the electric railway income of the country for one year. This amount is so trifling that it will undoubtedly be promptly forthcoming once the plan has been adequately set forth.

Such a contribution as may be requested should not be considered as an assessment, but rather as a share in a co-operative effort to save money for everybody. It is proposed to expend a considerable portion of the money for apparatus for joint testing, notably the machine mentioned in the June 17 issue of this paper. Expenditure for such equipment would be an investment capable of yielding results of permanence for many years to come.

The electric railway industry has done little in the way of co-operative research work involving physical apparatus. The steam railroads have done much in this line, the work of the Master Car Builders' Association and the American Railway Engineering Association being especially noteworthy. Railway engineers, college laboratories and college faculties have been pressed into service, with excellent results. To be sure the electric railways did support the Electric Railway Test Commission, organized in 1904 in collaboration with the Louisiana Purchase Exposition. The commission made a real contribution to the sum of electric railway data. This work, however, was done eighteen years ago, and the undertaking was directed specifically toward capitalizing for the electric railways the effort and expense incurred by manufacturers in assembling their great exhibits at St. Louis. It was a research proposition of a general character; the contributions toward its support had to be made on faith in the men who comprised the commission. The rail-joint program is more specific, the committee giving details in advance of the proposed expenditures. Its successful inauguration would be a credit to the industry.

City Planning a Necessity in Every Community

IT IS unfortunate that those who drew the plans for our cities did not have the gift of foresight, otherwise, in New York, for example, the blocks on Manhattan Island would have been arranged with their longer dimensions north and south instead of east and west. But when the streets in the central part of Manhattan Borough were laid out, there were no rapid transit lines other than the boats on the North and East Rivers and it was probably expected that most of the land traffic would be in an easterly and westerly direction. In consequence, the north and south avenues are so few that they are overburdened with traffic of all kinds, whereas many of the east and west streets, except at their crossings, have excess capacity. In the same way, it could hardly have been expected that any city planning done forty years or more ago would have taken into consideration the increased burden in the way of traffic placed upon the streets by the erection of buildings twelve to twenty stories high.

Regret for past errors is helpful only to the extent that it stimulates action to avoid their repetition. It may be out of the question to alter the arrangement of streets in the downtown sections of our cities, but it is not difficult so to plan for future growth that the same mistakes will not be made again. Intelligent thought on city development and requirements may even mitigate the troubles in the older portions of a city. It is with this purpose undoubtedly in mind that the trustees of the Russell Sage Foundation have appointed a committee to develop a comprehensive regional plan for New York City and its environs, and this committee has begun its work.

Some other cities have been more forehanded in this matter than New York, but in few, if any, has this phase of civic development been given the consideration it deserves. It is a phase in which electric railway companies have a special interest because of the close association between transportation and any intelligent plan for city growth. Too often in the past this vital connection between city development and urban transportation systems has been overlooked and, according to a recent address by Daniel L. Turner, consulting engineer of the New York Transit Commission, the mistake is still being frequently made.

While the problem obviously is more pressing in some cities than in others, no city large enough to support a local railway system can afford to ignore the question, and the earlier it is taken in hand the better. A city does not need to possess a subway to have a traffic congestion problem. It is large enough to engage in remedial measures if automobiles are beginning now to crowd its busiest streets. It may be that the local electric railway officials cannot dictate the method to be followed, because they will be considered to be interested parties, but they can call attention to the need of some action and can advise intelligently as regards any solution.

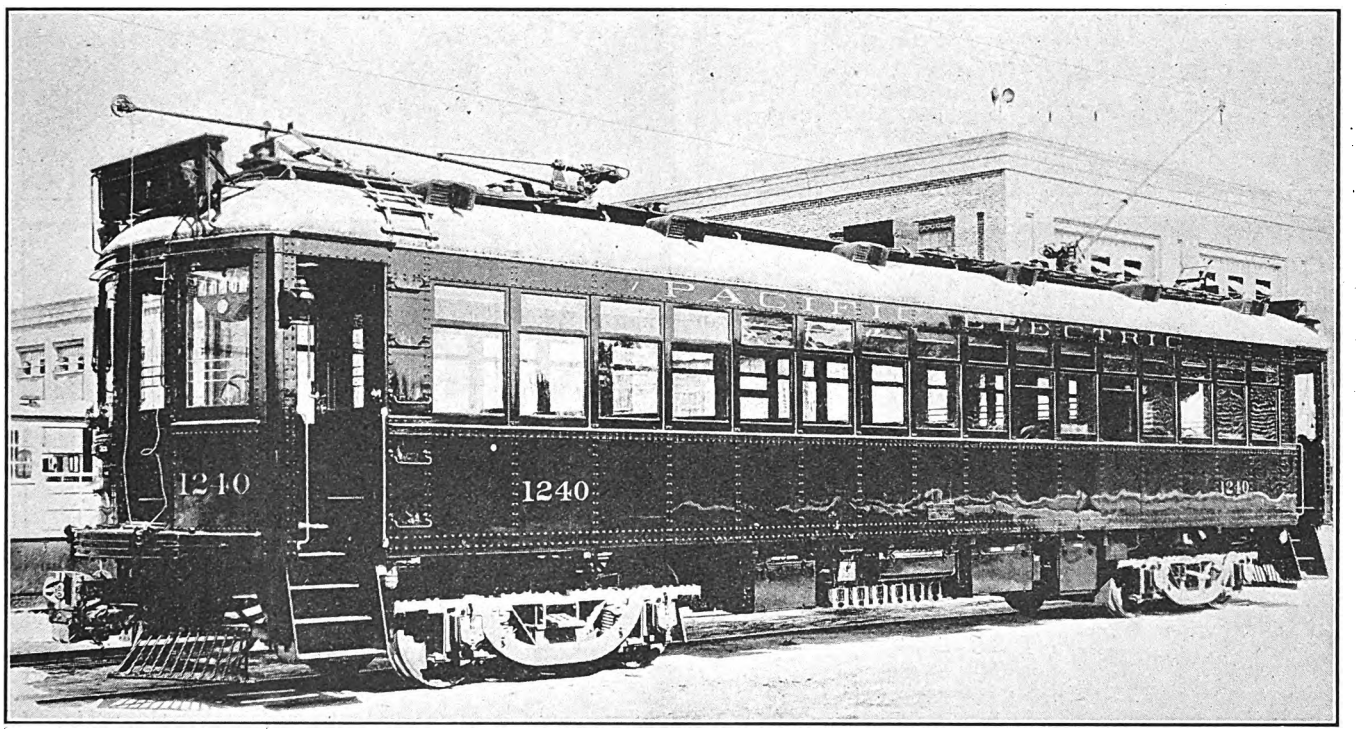
Control Equipments for Pacific Electric Railway

Twenty Motor Cars and Ten Trailers Arranged for Operation on Both 600 and 1,200 Volts D. C. Have Recently Been Added—Many New Features Are Included

BY W. M. HUTCHISON
Railway Equipment Engineering Department,
Westinghouse Electric & Manufacturing Company



NEW CAR OF PACIFIC ELECTRIC RAILWAY EQUIPPED FOR SERVICE

FROM an interurban railway operating over the 12 miles between Los Angeles and Pasadena, Cal., in 1895, the Pacific Electric Railway has expanded until it is now the largest and most extensive interurban electric railway system in the world, owning and operating approximately 1,100 miles of track in southern California and serving a population of over 1,000,000 people. This railway has contributed probably more than any other factor to the remarkable growth of Los Angeles and all of southern California. In 1920 alone the total number of passengers handled reached 96,290,906, while the freight handled by the company for the same period amounted to 2,717,363 tons.

Consistent with its policy of development and service, this company has recently placed in operation for interurban service between Los Angeles and Long Beach, Cal., twenty new all-steel motor cars and ten all-steel trail cars, equipped with quadruple Westinghouse type 557-D-7 motors and 600-1,200-volt HL control.

The total distance between Los Angeles and Long Beach is 20.37 miles, 4.35 miles of which is through the congested city districts. The schedule provides for a total running time of fifty-one minutes. Trains are normally made up of two motor cars and one trail car; however, the control apparatus has sufficient capacity so that a total of five motor coaches may be operated in the same train.

The cars were built by the Pullman Company and were equipped at the railway company's Torrence Shops. The general dimensions and construction of the trail cars are identical with those of the motor cars. The principal dimensions of the cars are indicated in an accompanying table.

BOX FRAME MOTORS USED

The motor equipment consists of Westinghouse type 557-D-7 motors of the standard box frame type, each rated at 145 hp. at 600 volts and insulated for the maximum potential of 1,200 volts. The main field windings are arranged to secure tapped field connections for the last running notch. Leads are brought out on the axle side and are covered with three-ply rubber hose. Special heat-treated, solid helical gears of forged steel are provided, pressed on an A. E. R. A. standard 6½-in. axle. The gears have fifty-eight teeth and are used with nineteen-tooth pinions.

WEIGHT AND DIMENSIONS OF CARS

Weight of motor cars completely equipped	107,680 lb.
Weight of trail cars completely equipped	78,000 lb.
Seating capacity per car	64
Length over end sills	47 ft. 2 in.
Length over end buffers	58 ft. 1 in.
Width over all at eaves	9 ft. 4¼ in.
Height of car body from running rail to top of roof	13 ft. 1-11/16 in.
Length between truck centers	34 ft. 0 in.
Wheelbase of car	41 ft. 0 in.
Wheelbase of truck	7 ft. 0 in.
Wheel diameter	36 in.
Weight of motors and gears	16,200 lb.
Weight of control equipment	5,200 lb.

The various auxiliary circuits, while complete, are simple and reliable. Energy for the control and lights is obtained at 600 volts on the 1,200-volt zones from a dynamotor compressor, which also supplies compressed air for the operation of the air brakes and control.

The heater circuits are energized directly from the trolley on both 600 and 1,200-volt zones, contacts being provided on a control changeover switch to establish the proper connections for either voltage. The signal system is operated from a six-cell Edison storage battery. A relay is located in the trolley circuit, which automatically gives the motorman the "stop" signal in case the trolley leaves the wire or if the power supply is interrupted for any other reason.

An auxiliary lighting bus line is provided for supplying energy for the lights and auxiliaries throughout the train. This energy is supplied from the trolley on the 600-volt zones or from the dynamotor on one of the motor cars on the 1,200-volt zone. A special protective relay is provided on each motor car which automatically cuts off the dynamotor from the bus line wire as soon as the latter is energized. This prevents feeding the bus line wire from more than one dynamotor in a train at any time. The control current for each motor car, however, is taken from its own dynamotor.

Details of the Control Equipment

The control equipment selected is arranged for automatic acceleration with full speed operation of the motors on both 600 or 1,200 volts, with provision for field control and for operation in multiple with type "M" control. As previously mentioned, 600-volt energy for operating the control apparatus is secured direct from the 600-volt trolley on 600-volt zones and from the dynamotor compressor on the 1,200-volt zones.

The main motor control consists essentially of twenty-three unit switches of the "HL" electro-pneumatic type, each complete with its magnet valve and operating cylinder. The switches are operated by compressed air taken from the air brake system, the admission of air to the switch cylinders being controlled by the magnet valves. These magnet valves are actuated by low-voltage current tapped from points on a control resistor which is connected between the 600-volt train line and ground.

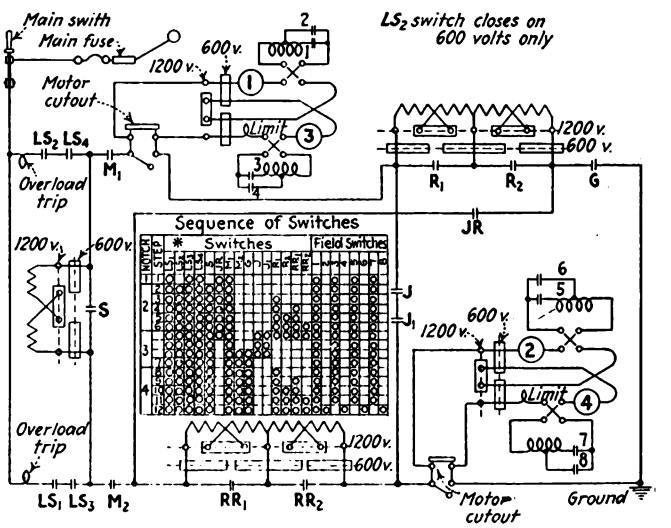
Four of the switches are mounted in a separate frame, together with two overload trip relays, and constitute the line switch. This line switch is especially designed for heavy duty and affords full overload protection as well as serving to open the circuit under normal conditions. The line switch is especially designed for mounting directly on the car body and really consists of a frame within a frame, the internal compartment being insulated from the external by insulated bolts. An especial feature of this line switch is the use of the two overload trip relays, so connected as to afford the same percentage protection on 1,200 volts as is obtained on 600 volts. Referring to the schematic diagram, with the changeover switch in the 1,200-volt position, the LS-2 switch is "locked out," through the control circuits, so that the total motor current passes through only one overload trip coil. In the 600-volt position the motors are connected in parallel pairs instead of in series, but the total current is divided between the two overload trips, so that the circuit is opened at the same current per motor in either case.

Eleven additional switches, mounted together in a common frame, are used to establish the main motor circuit connections and to make the minor changes in the motor circuit required to accelerate the car. In addition, eight unit switches mounted in a separate frame are used to establish short or normal field connections. With these switches and suitable starting resistance there are obtained five accelerating and one running notch in series and four accelerating and two running notches in parallel, the last of which is the short or normal field running position. Transition from the series to the parallel combination is accomplished by the bridging method.

The direction of motion of the car is controlled by an electro-pneumatically operated drum type reverser. It is operated by an air cylinder similar in construction to that employed for the operation of the unit switches.

Automatic Combined Air and Electric Couplers Used

The control is governed by master controllers, one of which is located in the motorman's compartment at each end of the car. Adjacent to the master controller



SCHEMATIC DIAGRAM OF MAIN AND CONTROL CIRCUITS, 600-1,200-VOLT, HL CONTROL

are located the changeover operating switch and a control circuit cut-out switch, including a reset contact for the line switch.

The train line, which extends the whole length of the car, terminates in combined air and electric automatic couplers at either end and is continuous from car to car. To the train line are connected the control circuits to the various pieces of apparatus so that when a control wire is energized by a master controller the corresponding train line wire is energized and all apparatus connected to that particular wire is actuated in unison throughout the train.

The functions of the 600-volt train line wires are relayed to the low voltage unit switch magnet coil circuits by means of two operating relays, designated respectively as the "multiple" and the "progression" relays.

By means of a line relay, the unit switches on each car are operated locally in case of failure of the line voltage, regardless of the position of the master controller. If the master controller is held in an operating position the control will automatically operate when power is restored, the switches closing in the proper

Digitized by Google

sequence until reaching the corresponding position of the master controller. Auxiliary contacts are provided on the line relay for operating a buzzer alarm system when the current collector leaves the wire, as previously mentioned.

The operating relays and line relay described above are mounted in a sheet-steel box, for convenience in arranging the apparatus under the car body. This relay box also includes a small "control" relay which is energized by the master controller in the "on" position, and through which the control resistor on each car is energized. With this arrangement a major portion of the control current on each car is supplied from its own dynamotor, rather than from the dynamotor on the car from which the train is being operated.

The various control resistance tubes required are also grouped for convenience in a similar box, arranged for mounting under the car. The length and position of the various tubes are such that tubes of unlike properties cannot be interchanged.

Two master controllers are used, one at each end of the car. They are of the single-drum type, operation in one direction effecting movement of the car forward, and the opposite operation effecting movement of the car in the reverse direction. A small latch is provided, however, which can only be operated with the handle in the "off" position and which "selects" the direction in which the handle is to be moved. This makes it impossible to throw the operating handle directly from a forward to the reverse position, or vice versa, without first pausing on the "off" position and operating the latch.

The controller is so arranged that the operating handle is returned to the "off" position by means of a spring when pressure is released. It also includes in the handle a button which, if released while in any operating position, operates a pilot valve to exhaust the air from one side of the piston of a relay valve, allowing the piston to open a port on its valve, thus exhausting the air from the brake pipe, and applying the emergency brakes. Consequently, release of pressure on the controller handle in any operating position opens the control circuit and applies the air brakes in emergency. A key is provided which locks the master controller handle in the "off" position, making the controller inoperative. The controller has four positions forward, *i.e.*, series switching, full series, parallel switching and full parallel, and two positions reverse, *i.e.*, series switching and full series.

Panelboard Mounting for Switches

At the rear of the motorman's station in the front of each car is located a control panelboard, inclosed in a suitable compartment. On this panelboard are mounted the various knife switches and fuses required in the control, light and heater circuits. The 1,200-volt heater and dynamotor switches are mounted on a separate base with barriers and covers, forming a complete switching cabinet, isolating them from the lower voltage apparatus.

On this panel are also mounted the limit relays which govern the rate of automatic acceleration, the lighting bus relays previously described and a control cut-out switch by means of which the train line may be disconnected from the control apparatus on any car.

The progression of the control is governed by the limit relays as they lift or drop under the action of the main motor current. One relay is provided with a shunt coil, which when energized opposes the flux of the main coil and so increases the relay setting. The control circuits are arranged so that this coil is energized when a pair of motors is cut out, thus permitting the car with a pair of motors out of circuit to accelerate in emergency conditions at practically the same rate as when operating with four motors.

On an interurban railway operating over both 600 and 1,200-volt zones considerable damage may be done if a car or train is run from the low voltage to the high voltage section without first rearranging the main and auxiliary circuit connections by operating the changeover switch that is provided for this purpose. In order to guard against damage under such conditions, a protective relay is used, which operates, when abnormal voltage is applied, to open the auxiliary and control circuits and drop out the main switches. This relay consists essentially of a standard electro-pneumatically operated switch unit and a tripping device similar to the usual form of overload relay except that it employs a voltage coil instead of a series coil, both mounted together with the necessary resistance in a common frame for car mounting.

If a car runs onto a 1,200-volt section with the circuits arranged for 600-volt running 1,200 volts will be applied across the trip coil, which will operate its plunger to open the circuit to the valve magnet coil on the pneumatic switch. This drops out the switch, which disconnects the control and auxiliary circuits from the 1,200-volt source of supply. A contact disk on the trip also opens the circuit to the line switch valve magnet coils. The switch cylinder is provided with an inlet port of reduced size in order to provide a slight time element in closing, so that in case a high voltage is applied when the switch is open the trip coil will function before the switch can close. After the protective relay has operated it is necessary to throw the changeover switch to the correct position and momentarily lower the trolley, when the trip plunger is released and the switch again closes.

Changeover Switch Establishes Connections

An electro-pneumatically operated drum type changeover switch establishes the main, control and auxiliary circuit connections necessary to secure full speed operation of the motors and identical operation of the auxiliaries on both 600 and 1,200 volts. When changing from the high-voltage to the low-voltage position the starting resistance sections are paralleled to produce one-quarter the resistance and the motors are connected in parallel pairs. As the voltage has been reduced to one-half and the resistance to one-quarter of its former value the current through each motor remains the same.

An especial feature of these changeover switches is the method of operation. A combined air and electric changeover operating switch is provided, which in addition to contacts for energizing the proper operating valve of the changeover switch for 600-volt or 1,200-volt operation includes a pneumatic valve connected directly to the operating cylinder. Operation of this switch establishes control circuit connections for operating the changeover switches throughout the train and through the valve throws the changeover switch directly in the car in which it is operated. This makes it possible to operate the changeover switch in the leading car, should a train run onto a 1,200-volt section with the changeover switch in the 600-volt position,

Digitized by Google

causing the protective relay, described above, to operate and cut off power. After the changeover switch has reached the 1,200-volt position the protective relay is automatically reset by momentarily lowering the trolley, and control energy is then available for operating the changeover switches electro-pneumatically throughout the rest of the train through the control contacts on the operating switch. Without this feature it would be necessary to operate the changeover switch on the first car by hand after the protective relay had opened the control circuits.

Particular attention has been paid to the problem of assuring continuous service by adequate protection of the equipment under all operating conditions. Some of the outstanding features may be summarized as follows:

(1) The use of a rugged, reliable line switch especially designed for heavy duty on both normal shut off and overload; (2) an arrangement of main circuit apparatus to secure the same degree of overload protection on both 600 and 1,200 volts; (3) the use of separate unit switches to establish normal or short field connections; (4) provision for increasing the accelerating current per motor when one pair of motors is cut out of circuit so that the car accelerates at practically the normal rate; (5) the use of a protective device, to prevent damage due to overvoltage, which is readily reset from the car after the correct connections have been established, and (6) the "dead man's" feature in the master controller which interrupts the power circuit and applies the emergency air brakes in case of man-failure.

In addition, the control includes all the fundamental principles of automatic control and the well-known successful attributes of the electro-pneumatic unit switch system.

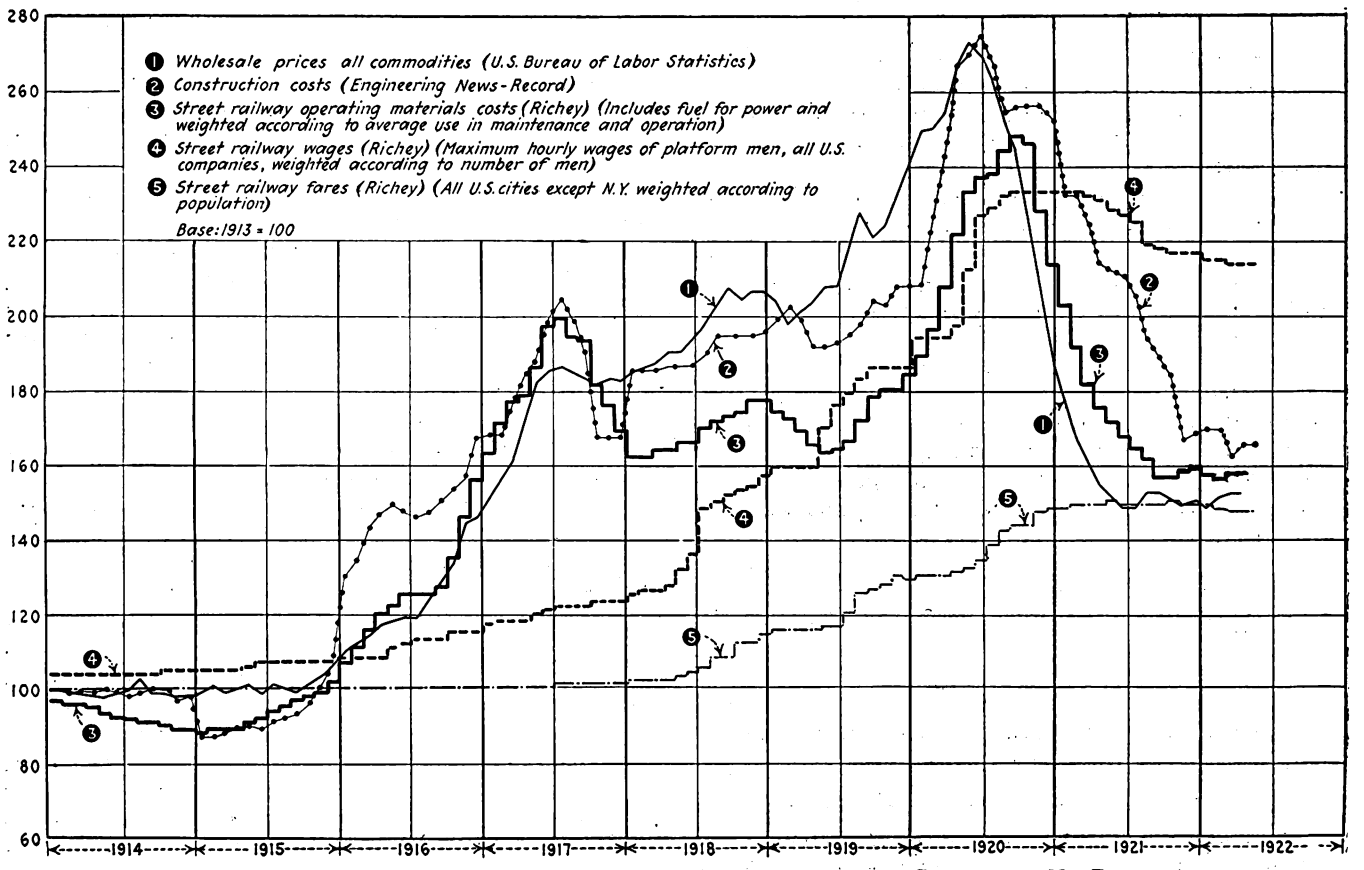
Trend of Prices, Wages and Fares

Chart Shows Variations During Last Ten Years in Wholesale Prices and General Construction Costs and in Electric Railway Material Costs, Wages and Fares — Based on Figures Assembled and Compiled by Albert S. Richey

DURING the past five or six years events principally influenced by the world war have produced most violent changes in price levels. The extreme fluctuations which have been taking place have awakened a wide interest in various "indexes" designed to measure the movements of prices or costs of different sorts of commodities, labor and the like. While the high peaks in such costs appear to have been passed, generally having occurred during the year 1920, interest is now centered on the return of the several indexes to normal, together with a considerable amount of speculation as to just where and when normal conditions are to be reached.

A tabulation of twelve indexes of special interest to electric railway operators, under the heading "Conspectus of Indexes," assembled (and in part compiled) by Albert S. Richey, has been appearing in the Financial and Corporate department of this paper for the past several months. The chart, which is given below, depicts, by a series of lines, the trends of five of these indexes from the beginning of 1914 down to date, each to the scale of its average value during 1913 equaling 100. Three of the indexes shown have to do particularly with electric street railway operation and are those compiled by Mr. Richey, namely, those of operating materials costs, wages and fares. The two others are of more general derivation, namely, construction costs and all commodities.

As numbered on the chart, No. 1 shows the trend of the wholesale prices of all commodities, as compiled by the United States Bureau of Labor Statistics. This



TREND OF PRICES, WAGES AND FARES, BASED ON FIGURES ASSEMBLED AND COMPILED BY MR. RICHEY

Digitized by Google

index is made up from average prices on more than 300 commodities, obtained by the bureau monthly from all parts of the country, and weighted according to the estimated quantity of each article marketed. The commodities used are divided into nine classes: Farm products, food, cloths and clothing, fuel and lighting, metals and metal products, lumber and building materials, chemicals and drugs, house furnishing goods and miscellaneous. Since the list of commodities is so comprehensive and the weighting is done so carefully, this index is recognized as authoritative as very accurately portraying the trend of the general price level of all commodities in this country. The sub-indexes relative to the nine general groups listed, also published monthly by the bureau, are equally reliable and are commonly used to indicate the price trends in these general groups.

As indicated by the chart, the all-commodities index varied little from the 1913 level until late in 1915, when an upward trend began; this accelerated rapidly after the middle of 1916, and with but temporary halts increased to the high point of 272 in May, 1920. During the following year the recession was most rapid, reaching 151 in May, 1921. In the past year the variation has not been more than two points on either side of 150.

CONSTRUCTION COSTS

The second index shown in the chart is that of construction costs, as computed by the *Engineering News-Record*, using the elements as follows:

Structural steel in Pittsburgh	37.50 per cent weighting
Cement f.o.b. Chicago	7.14 per cent weighting
3 x 12 to 12 x 12 Southern pine in N. Y.	17.10 per cent weighting
Average price common labor, eighteen to twenty cities	38.00 per cent weighting

As the price movements in these basic materials are similar the country over, and as the labor unit is averaged from the rates in a large number of cities, this index should be closely indicative of general construction costs in the United States. Local costs may be influenced by the prices of brick, sand, gravel, crushed stone and other materials locally produced, but such prices are so affected by local conditions that they have no place in an index which attempts to portray nation-wide trends.

The *News-Record* construction cost index has followed the all-commodities index in general trends. It rose earlier in 1916, and later in 1919-20, but to about the same high peak. It fell more slowly, and four to eight months later, but since November, 1921, has remained close to 165.

It may be of interest to mention here an index of electric railway construction costs which was developed by Robert M. Feustel in connection with a study of costs on the property of the Philadelphia Rapid Transit Company. The index was found to agree very closely with construction costs on that property and was made up of elements as follows:

United States Index, "all commodities"	64.54 per cent weighting
Steel rail	14.76 per cent weighting
Local labor	6.61 per cent weighting
Ingot copper	6.19 per cent weighting
Common brick	7.90 per cent weighting

On the basis of 1913 = 100, the index showed for the Philadelphia property a peak of 252 in May, 1920, and a recession to 151 in December, 1921.

STREET RAILWAY OPERATING MATERIALS

The index of street railway operating materials costs (shown in the chart as No. 3) is compiled by Mr. Richey and is a combination of three of the price indexes of the United States Bureau of Labor Statistics, metals, lumber and fuel. These indexes are weighted in such a manner as to represent the general price level of the materials entering into normal maintenance and operation of the average street railway, including fuel for power.

This index showed a sharp rise to a peak of 199 in July, 1917, then a falling off with fluctuations between 160 and 180 in 1918 and 1919, a rise to the high peak of 247 in September, 1920, a rapid drop to 156 in September, 1921, and finally a fairly steady hold between 156 and 159 for the past eight months.

STREET RAILWAY WAGES

The Richey index of street railway wages (No. 4 on the chart) is compiled by averaging the maximum hourly rates of conductors and motormen of a large number of city and interurban companies, weighting the rates of the various companies on the basis of the number of passenger motor cars operated. The index therefore closely represents the trend of the average wages of United States electric passenger car operators.

The rise in this index was constantly evident, but with two pronounced jumps, one in 1918 and one in 1920, to a maximum of 232 in September, 1921. From 1916 to the latter part of 1921 the wage index was under the all-commodity index, or general price level, both referred to 1913 as a base. However, the recession of the indexes of commodities in general, construction costs and operating materials has not been matched in degree by that of the wage index. Its drop from the high peak of 232 was only to 213 by May of this year—a drop of but 8 per cent.

STREET RAILWAY FARES

The index which stands out on the chart so markedly in its dissimilarity to the others is that of street railway fares. This index is also compiled by Mr. Richey and is the relative average of the street railway fares in all United States cities having a population of 50,000 or more (except New York City), and weighted according to population.

As published monthly in Mr. Richey's "Conspectus," the figures are given in cents and show the 1913 average fare of 4.84 cents remaining almost unchanged until the middle of 1917. A fairly uniform rise, beginning in May, 1918, reached its highest point of 7.24 cents in May, 1921, from which the average has dropped to about 7.14 cents at present. The chart shows this index, for purpose of comparison with the others, in terms of the 1913 base = 100.

In the past year the fare index has been very close to the all-commodity index, and within 10 points of the operating materials index, while the wage index is still 66 points higher than the fare index. In other words, the average citizen is paying 47 per cent more for a car ride than in 1913, almost the same as the increase in the cost of all commodities combined. At present, also, the average car operator is getting 113 per cent more for his work, and materials for operation are costing the railways 57 per cent more. It is well known that the average investor in street railway securities is, as a consequence, getting a diminished return on his investment. Much has been and must be done in the way of economical operation, and some further adjustment must be made in wages before conditions can again be accepted as normal or livable.

How Resistance Is Used in Railway Automatic Substations

Views of Several Electrical Engineers of Long Experience with Automatic Substations Are Presented on the Question of Using Resistance in the Machine Circuit, or in the Feeder Circuits, or Both

THERE has been a great deal of discussion pro and con about the use of resistance in the machine circuit and in the individual feeder circuits in automatic substations as a means of protecting against overload without cutting off power altogether. To bring together a summary of the experience and opinion on this subject and the practices being followed in the various installations the editors of ELECTRIC RAILWAY JOURNAL invited certain electrical engineers who have had extensive experience with automatic substations to express their ideas and experience for the general advancement of the study. Their views are presented in what follows:

G. G. Post, electrical engineer the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., comments briefly on this problem thus:

"We do not use resistances in the individual feeders and do not believe it is a good plan to do so. We think that as far as possible the station should operate just as it would if it were controlled by an operator and that if anything happens on an individual feeder it should kick out and stay out until the trouble is cleared. Automatic reclosing circuit breakers can be used for this purpose." All of the railway automatic substations in use by the Milwaukee company are in interurban service.

John M. Drabelle, mechanical and electrical engineer Iowa Railway & Light Company, Cedar Rapids, Iowa, is of the following opinion:

"The arrangements of resistances in an automatic substation depend entirely upon the operating conditions and circuit layout involved. No hard and fast rule can be laid down. I believe for interurban service a single bank of resistance in the machine circuit is the proper way of handling the load, but for city service the resistances should be in the individual feeders. It seems to me that it is up to the engineer on the job to do some good, careful work and study out his problem rather than to depend on a cut and dried, or more or less arbitrary, arrangement of resistance."

E. J. Nash, electrical engineer Butte (Mont.) Electric Railway, responds to the question with these thoughts:

"The operating conditions in themselves govern whether it is advisable to use the load-limiting resistances in the feeder or machine circuits. Where the station feeds three separate sections, as does the automatic station of the Butte Electric Railway, it is preferable that the resistance be in the feeder and machine circuits. Whatever resistance is in the machine circuit may be omitted from each of the feeder circuits. The resistance in the machine circuit, which is inserted between the converter and the trolley when an overload occurs on any one section, does not cut the voltage down sufficiently to overload any of the other stations. But this resistance, together with the resistance in the feeder circuits, prevents an overload upon the automatic machine even with one of its feeder trolleys grounded. In consequence, by proper setting of the thermostat, the feeder circuits will be opened by a continued overload and yet the station will still feed the remaining sections."

E. H. Scofield, engineer of power Twin City Rapid Transit Company, Minneapolis, Minn., has reached the following conclusions as a result of his experience:

"Where only a single unit is employed, we consider it best to place the resistance in the main machine circuit rather than in the individual feeder circuits. The main argument for this is that the purpose of the resistance is to protect the machine from overload, rather than to reduce the overload sent out on any individual feeder. This plan of using the resistance in the main circuit results in supplying a relatively higher voltage to the overloaded line in case of an overload. In the other case, when resistance is inserted in the individual feeders, the result is to reduce much lower the voltage on the line which needs the extra power.

"In this plan of using resistance in the main machine circuit the protection against grounds or short circuits on the individual lines depends entirely upon the automatic circuit breakers or switches controlling the lines. This same plan is also employed under similar conditions in two substations of the Duluth (Minn.) Street Railway, with very satisfactory results. For all conditions so far considered, I believe that this method of limiting the output is preferable."

E. F. Gould, assistant general manager Aurora, Elgin & Chicago Railroad, Aurora, Ill., has had very good results from the use of resistance in the machine circuit only in both automatic and manually operated substations, and he says:

"It has appeared to us that on our system and under our conditions the resistance should be used for the protection of the rotary converter and located in the machine circuit. I think this is the operating condition most often met with in practice, though there might be cases where it would be desirable to locate resistance in some particular feeder on which excessive overloads occur frequently, or on a feeder where it was essential that a total interruption of current be avoided.

"A number of years ago we installed a complete automatic substation at a point on our line where such an installation is feasible, employing, as part of the equipment, load-limiting resistance connected in the machine circuit. This has proved very satisfactory and has given complete protection against excessive overload.

"Later on we installed load-limiting resistance only, in connection with converters in two of our manually operated substations. These resistances were also placed in the machine circuit and have served very satisfactorily, protecting the machines against excessive overloads at these points, which overloads have in past times caused a number of burnouts on these particular converters. It is our opinion that the use of load-limiting resistance in the machine circuit greatly increases the capacity of the old type rotary converter for handling overloads successfully. In our case it was about the same as converting a 500-kw. converter into one of 750-kw. capacity."

Digitized by Google

Charles H. Jones, electrical engineer Chicago North Shore & Milwaukee Railroad, who is responsible for a very extensive installation of automatic substations in high-speed interurban service, has these views on where load-limiting resistance should be connected in, and on the idea of leaving out resistance altogether as suggested by certain persons:

"This is one phase of the automatic substation problem which has caused considerable controversy among operators of this type of equipment. A great many of the criticisms which have been offered against the use of limiting resistance no doubt merit consideration, but to a large extent the criticisms are based on theory rather than on actual practice. In discussing the subject it is necessary to divide it into the various classes of service to which automatic operation of substations is applied: (a) in a heavy city network; (b) on an interurban line; (c) for heavy traction work.

Resistance in City Service Substations

"In cases where a number of feeders come out of a station used in city service it has been customary to divide up the load-limiting resistance by placing a portion of it in the machine circuit and the remainder in the feeder circuits. The reason for doing this is to penalize only the feeder circuits which are producing the extremely heavy loads and allow the other feeders to have full voltage applied to them. In practice it has worked out that these overloads are of rather infrequent occurrence and generally are very well diversified so that the machine can safely carry this individual feeder overload for a limited period of time. In the course of development of substations for use on this class of work it has become rather common practice to eliminate the resistances in feeder circuits entirely and replace them with automatic reclosing circuit breakers.

"In order to protect against the overload on the machine, some persons have advocated the use of a shunt-wound converter in place of the usual compound-wound machine, as the shunt-wound machine has a drooping characteristic. That is to say, as the load comes on the voltage gradually drops off, and hence the load which the machine can possibly carry will be reduced. This theory does not seem to be very well founded, as in carrying overloads by this method the power factor of the machine also drops off quite rapidly. The result is that just as much damage may be done to the machine as would be done to a compound-wound converter without resistance, although the useful power output is substantially limited. In an extensive substation network, where the feeders are interconnected between two or more substations, this general method would be of limited value, as the reduction of voltage in one substation would cause the heavy overloads on the feeders to be normally picked up by the adjacent stations.

"Personally, I would not be willing to make an installation depending on the drooping characteristics of the machine only as the load-limiting scheme, as it is very possible that some of the protective features provided might not be ample fully to protect the equipment. In cases of extreme emergency, I would feel much more confidence in having a load-limiting resistance to cut in, thereby reducing the load to a point which could be absolutely predetermined.

"My own opinion is that the protective features should be based to operate on the current output of the machine or on the amount of heating which actually takes place within the armature. This would no doubt call for the insertion of thermocouples within the armature itself. The manufacturers, however, have not come to the point of believing that this is necessary. In a properly laid out distribution network using automatic substations there should be very little necessity for the load-limiting resistance to be brought into the circuit for an appreciable length of time, therefore the losses in the resistance should be a very small amount.

In Interurban Service Substations

"In the case of automatic substations applied to interurban roads the condition is entirely different from that in city work. The train spacing is considerably longer and the ratio between peak loads and average loads is considerably higher. In many cases it is financially impossible to install sufficient converter equipment to carry the peak loads unrestricted. In stations used on lines of this class there are usually very few feeder sections. Generally, there will be two sections, one going out in each direction from the station, and a considerably higher load will normally be expected on one feeder than on the other as a train is passing through. Therefore, there is a better reason for bringing in a certain amount of limiting resistance on the heavily loaded feeder than exists in the substation on city work. It is this feature of the question with which I am most familiar and our experience has been to use limiting resistance in both the feeder and machine circuits. The results obtained have been very satisfactory and actual tests made show that the energy losses in resistance are comparatively small.

"I have recently made an automatic substation installation on the Chicago & Interurban Traction Company line on which I placed all the resistance in the machine circuit and used automatic reclosing circuit breakers on the feeder circuits. The conditions on this line are considerably different from those on the North Shore Line and my reason for making the installation as I did was to determine, if possible, whether there was any particular advantage in it.

"With reference to substations for use in heavy traction systems, I am of the opinion that it will require very careful study and investigation to determine whether or not it is desirable to use load-limiting resistance in either the feeder or machine circuits. I recently had occasion to visit certain heavy electric traction roads and after studying very carefully the extremely heavy loads which they encountered, I came to the conclusion that only experience will determine exactly what course to follow."

Experience from City Served Completely by Automatics

F. C. Chambers, president Des Moines City Railway, who is responsible for the first complete installation of automatic substation equipment in city service, holds the opinion that whether or not resistance is necessary or desirable in the feeder circuits depends to a great extent upon local conditions. He discusses the problem as it occurs in city and interurban service as follows:

"On our interurban lines we are using resistances in the feeders as well as in the machine circuit. We have found this arrangement advantageous in several cases, as for instance when there is a break in the trolley between two substations which are automatically controlled and the trolley wire is on the rail so as to throw a very heavy overload on the rotary converter closest to the break. In such a case the feeder resistance would be inserted in the circuit by the action of the overload

Digitized by Google

relays and the bus voltage at the substation would remain normal, permitting normal operation on the other section adjacent to this substation. This is desirable indeed in order to get the trouble car to the point of the trolley break without undue delay. We have experienced numerous other similar cases, such as congestion of traffic between substations which, without feeder resistances, would have interfered with the operation on other sections.

"It is also our practice to use feeder resistances in our city substations. However, I feel that the advisability of using resistances in city work will also depend largely upon local operating conditions. To illustrate this, we will assume that we have a rotary converter having a total capacity of 2,000 amp., that there are eight feeders supplied by this station and that in order to handle the peak load requirements the maximum setting of the feeder relays is 1,000 amp. and that the average load on the feeders is 200 amp. We will further assume that the relay controlling the first step of resistance on the rotary converter is set to operate at 2,000 amp. Under these conditions, the average load on the machine with a load of 200 amp. for each feeder is 1,600 amp. It would only require an additional load of 400 amp. on any one feeder, bringing the total ampere load in that feeder up to 600 amp., to operate the relay controlling the first step of resistance in the machine circuit.

"Under these conditions it is very evident that the feeder resistance would be inoperative inasmuch as the machine resistance would be cut into circuit before the current in the feeder had risen to a value high enough to operate the feeder relay. Of course, this is a theoretical case, but I have seen it work out a number of times in practical operation in our substations. On the other hand, we have had numerous cases where the relays controlling the feeder resistances have operated during a congestion on the lines supplied by these particular feeders, despite the fact that the conditions were apparently identical with those set forth above. In these instances, were it not for the fact that the feeder resistances were used, the potential on all lines feeding from this particular station would have been reduced and the load transferred onto adjacent substations, with the result that schedules would be slowed up and possibly add further to the congestion due to the lowering of the voltage at the bus.

"I have given this matter considerable thought and my experience has demonstrated pretty conclusively that if I had the installations to make over again, both on our city and interurban systems, I would use feeder resistances in both cases, despite the fact that without them the initial cost of the equipment could be materially reduced and less space would be required for the equipment."

Experience in Metropolitan Street Railway Service

L. D. Bale, superintendent of substations Cleveland (Ohio) Railway, has probably had the most extensive experience of any electrical engineer with the automatic substation as applied to the very large city railway system where any interruption to service is of gravest concern. His views on the subject under discussion are therefore of great interest. He writes:

"This question in my estimation is a variable one, depending upon many conditions. There are primarily three combinations: (1) resistance in both machine and feeder circuits; (2) resistance in the machine circuit and the so-called differentiating transfer scheme in the feeder circuits, and (3) resistance in the machine circuit with automatic reclosing circuit breakers on the feeders. A fourth system is being worked out in Cleveland at present, using the resistance in the machine circuit and the differentiating scheme worked out on the feeders in conjunction with an auxiliary bus and remote control. Which of these four ideas is to be used depends in my estimation entirely upon the class of service, the importance of the station to the system, and the size of the system.

"It has been demonstrated in Cleveland that with limiting resistance on tie feeders of relatively low ohmic resistance, the contactors on these feeders will on normal overloads open and close in rapid succession (pump), simply transferring the overload to adjacent stations momentarily. On stub-end feeders this system of resistance would be satisfactory in most cases, for since there is no other source of power to the feeder there would be the absence of pumping on overloads. Another difficulty with the resistance plan on important feeders is the fact that in the event of legitimate overload occurring, resulting from a tie-up for example, the resistance would be inserted in the feeder, thus lowering the voltage at the most inopportune time, for in this case it is desirable to furnish the best power possible.

"With the second combination mentioned; that is, differentiating schemes with no limiting resistance in the feeder, the operation of the transfer device as caused by short circuit only, requires that the feeder or section shall remain dead until such time as the trouble has been removed. There are some systems in operation where it is desired to burn off all grounds possible and attempt to maintain service on the lines under all conditions. It is readily seen that with the scheme under discussion this burning off cannot be accomplished. This is also generally true with the third combination; that is, when using the automatic reclosing circuit breaker.

"The fourth combination; that is, the differentiating scheme with auxiliary bus and remote control which is being worked up in Cleveland at the present time, is designed to meet with the demands of the management for just as near 100 per cent continuity of power as possible and the maximum degree of reliability and flexibility in the distributing system. Briefly, the operation is as follows:

"In the event of a feeder grounding, it will automatically be transferred from the main bus to the auxiliary bus, in which position it will be fed power through tie feeders transferred to the auxiliary bus by means of remote control, thus burning off any normal ground. There will also be installed a current-limiting resistance between the main bus and the auxiliary bus under remote control, that may be used in conjunction with tie feeders for burning off purposes. Quite aside from the question of grounded feeders, it can be realized that this system will constitute a most flexible arrangement whereby load may be transferred or shifted at will to relieve almost any emergency condition that may arise.

"Regarding resistance in the converter circuits, I personally do not believe the elimination of this resistance to be the proper thing at the present time. This, however, may come later, possibly when the high-speed circuit breaker has been perfected and can be purchased at a sufficiently reasonable price to install upon feeders."

General Features of A. R. A. Exhibits

Many New Devices and Important Developments in Specialties and Railroad Equipment Which Have Been Brought Out Since 1920 Shown at Atlantic City Convention of American Railway Association, Mechanical Division—Machine Tool Exhibits of Particular Interest

THE American Railway Association, Mechanical Division, which includes the former Master Car Builders' and Master Mechanics' Associations, met at Atlantic City, N. J., June 14 to 21. An exhibit of railway supplies on Young's "Million Dollar Pier" was an important feature of the convention and as no exhibit was held last year particular interest was shown in developments which have occurred since 1920. In the variety of equipment shown, this year's exhibit surpassed all predecessors. The floor space occupied by the exhibit did not quite equal that of 1920, but this was due to the fact that the galleries were not used for exhibits this year, as they were in 1920. All other available space on the pier was occupied. About 96,000 sq.ft. of exhibit space was available.

There were 341 exhibitors, and the exhibit committee reported that seventy-five applications for space could not be granted. Many exhibitors were forced to use less space than they contemplated using, as the committee found it necessary to cut down the space allotments to accommodate more exhibitors. The exhibit committee established a new record this year in the promptness with which material was delivered and installed. Shipments of exhibits arrived earlier than usual in Atlantic City, and when the convention opened on Wednesday morning all was finished and in readiness for the visitors. The general impression conveyed was that there was a greater variety and a larger number of small equipment devices exhibited. Machinery Hall was filled with the usual types of machine and shop tools and, as at previous conventions, this was a special feature which attracted considerable attention. Developments in chucking devices and in the control of the operations of the various shop machines were especially elaborate and showed that manufacturers had given special attention to cutting down the time and labor necessary in machining various parts.

Improved Equipment Exhibited

A motor-driven portable woodworking machine was shown. This is designed to perform many different woodworking operations. The driving motor and operating parts are mounted on a small four-wheel truck which runs on a track the full length of the carpenter's bench. Planing, beveling, ripping, mortising and similar work can be done with the same machine by simply attaching the required tools.

Other shop equipment and machine tools of new design or with new attachments included a 42-in. vertical boring and turning mill with many new features of design, improvements in lathe construction with new geared heads and motor drive arrangements, tool posts designed to increase the speed of changing cutting tools, planers designed to combine high productive capacity with maximum ease of operation, metal and band saws with special attachments, and an air brake hose dismantling and assembling machine. A new electric hoist developed for use with limited headroom formed an interesting exhibit. The 3-ton hoist exhibited can be operated with a headroom as low as 14 in.

Many models of industrial trucks were shown also. A type of truck particularly adapted for use in electric railway shops and storerooms consisted of a combination electric crane mounted on a truck. This is intended for service where material is to be raised or lowered and then transported horizontally. Other types were provided with low platforms and elevating platforms for convenience in loading and distributing parts at different levels.

A moisture separator for shop air lines, particularly adapted for use in railway shops, was shown. The use of this device is very desirable in connection with paint spraying operations and also for use where air lines are used for blowing out various electrical equipment parts. Where air hammers or air-operated tools are used their efficiency is increased when clean dry air is available, and freezing during severe winter weather is prevented.

Comprehensive Display of Pneumatic Tools

New developments in pneumatic tools included a sleeve-type valve for riveting hammers, a progressive lock for both chipping and riveting hammers to prevent the handles from coming loose on the cylinders, and a drill motor with an improved toggle connecting the piston rod to the crank pin. The sleeve valve for riveting hammers is designed to eliminate valve breakage and to reduce to a minimum the necessity of oversizing valves. The toggle for connecting the piston rod to the crank pin is designed for minimum weight consistent with strength so as to prevent crystallization in the companion parts and enable it to stand up under the severe service required. Constant lubrication direct to the crank pin is also provided by means of this new toggle. A patented breather tube has also been developed for drill motors. Heretofore drills and other similar tools have required lubrication at quite frequent intervals, but with the breather tube the period is lengthened considerably.

A new self-lowering ball-bearing jack was exhibited. This is designed with its own brackets and wheels attached. The wheels are 5½ in. in diameter and the operating lever is arranged so that when inserted in a socket it can be used as a handle for wheeling the jack about. The lowering of the load is controlled by a small lever at the side of the jack through worm gears.

A large amount of welding equipment was displayed. It included all classes of gas, electric and thermit welding apparatus. Automatic arc welding was given particular attention. The field of usefulness for these automatic machines has been found to be much larger than was originally expected. Exhibits also included many car construction parts and truck parts with electric welding in place of previous designs with rivets.

A portable electric-welding device which controls the feeding of the electrode wires into the arc and which can be used in any place where welding current is available was shown in one of the exhibits. The automatic and semi-automatic method increases the speed of welding and makes it possible for a comparatively inexperi-

Digitized by Google

enced man to do good work consistently. A large-capacity portable welding outfit was also shown. It consisted of a motor-generator set and control apparatus mounted on a four-wheel hand truck. The generator has a continuous capacity of 300 amp. and for cutting and other work of an intermittent nature will develop 400 amp. The set is supplied with either direct or alternating current motor and weighs complete about 1,700 lb.

MANY INTERESTING CAR FIXTURE EXHIBITS

Electric railway officials found much to interest them in the exhibits of car parts and car fixtures, specialties and appliances. These included new types of seats and seat parts, car trimmings, hardware, curtains and safety treads, together with displays of drawn steel and pressed steel shapes and stampings.

A renitent car window post of new design was shown. The use of this post makes the sash watertight, rattle-proof, interchangeable and safe against sudden dropping. It has the advantage of being easily removed from its runways without the use of tools. A metal-bound felt weather stripping for car windows was also shown. This is made of all-wool, hand-pressed weather felt cut to length as specified.

Other exhibits of special interest to rolling-stock engineers were those of trucks, wheels, brakes, brake shoes, slack adjusters and foundation brake rigging. A car truck with wrought steel side frames formed in one piece attracted considerable attention. The blank for the complete frame is produced from a steel blank in one piece, and at one operation by shearing between dies under a hydraulic press of high capacity. Renewable wear plates are welded to the faces of the columns, thus preventing any wear of the column proper by the bolster. The brake hanger brackets are of malleable iron riveted in the standard location and arranged to take their regular hangers and pins. A wrought-steel truck bolster flanged or forged in one piece from a steel plate was also shown. This bolster plate is first blanked out, then flanged and finally folded into a complete box section, the contacting flanges being welded together along lines not subject to service stress. Reinforcements are provided under the center plate and over the truck springs, and the bolster guides are of the usual standard design.

A new design of roller bearing truck was also shown this year. The rollers for the radial load are mounted in a double squirrel cage. For a 5-in. x 9-in. journal there are thirty-six rollers, two sets of eighteen each, ¾ in. in diameter and 2½ in. long. The rollers are of chrome steel, oil treated. Beyond the roller cage, toward the end of the axle, is a roller thrust bearing which is held between two bearing plates. The entire assembly is secured by a nut on the end of the axle, this nut being secured by a bar lock held by two screws.

Several new designs of journal boxes were shown. One consisted of a malleable-iron journal box equipped with renewable pressed steel liners in the pedestal ways and equalizer seats. The pedestal-way liners are formed of mild or medium steel, so as not to wear the more expensive pedestal jaws. The liners are heated before application to the box and forced into position, and the top and bottom ends are clamped securely around the corresponding ribs of the box. A hoodless lid for journal boxes formed a part of one exhibit. This lid covers the box face entirely across the top as well as at the sides and bottom. Hair-fiber dust guards which are said to be superior to and more durable than the old type of wooden guards for truck journal boxes were also shown. These dust guards are furnished in three styles, consisting of plain composition felt, the same guard waterproofed, and one with a hair fiber reinforced on both sides by jute fiberboard.

Two new designs of brake-shoe keys were shown. These had special features to prevent their becoming loose and lost. The principle of these keys was to provide a spring construction which could be readily inserted and when installed would provide sufficient pressure to lock the key in position. The keys are made standard in all essential dimensions.

A new device exhibited this year which proved of special interest to master mechanics was a surface metal gage for gaging the amount of metal to be removed from worn flanges of wheels to restore the standard contour and to indicate in advance of turning the final tape size of the wheel, so that remating could be done without loss. The gage also indicates the amount of surface metal that will remain after turning. This latter provision frequently foretells that the wheel will fall within the scrapping limit after it has been re-turned and thus not only saves the labor of re-turning but prevents the handling of wheels unnecessarily.

Safety Campaign of Long Island Railroad

Statistics Show that Plan Is Worth While—Special Efforts Are Now Being Made with a View to Reducing Grade Crossing Accidents

OWING to the extent of its suburban service the Long Island Railroad has long been prominent in safety work. The company has a general safety committee, with L. S. Wells, electrical superintendent, as chairman, and six sectional committees. Meetings of the general committee are held quarterly and of the sectional committees monthly, and it is expected that these committeemen will exercise special vigilance in the interest of safety and will report any defective conditions which may come to their notice. The labor organizations have supported the movement cordially.

Since the inauguration of the safety organization, more than 4,000 suggestions relating to unsafe practices and conditions have been considered by the safety committee, and the results have been well worth while, as indicated by the following summary of persons killed and injured (including suicides and trespassers) during the past three years:

	Total Killed	Total Injured
1918	79	2,753
1919	45	2,137
1920	34	1,278
1921	37	1,002
Net decrease (three years)	42	1,751

No passengers were killed during 1919-1920-1921, and there has been a gratifying decrease in the number of casualties to employees.

Unfortunately equally good results have not been obtained in the case of accidents at grade crossings and to trespassers on the right-of-way. This may be accounted for by the fact that it is difficult to reach the people involved in such accidents. Hence the company is taking an active part in the general safety movement of the American Railway Association, known as the "Careful Crossing Campaign," effective this year during June, July, August and September.

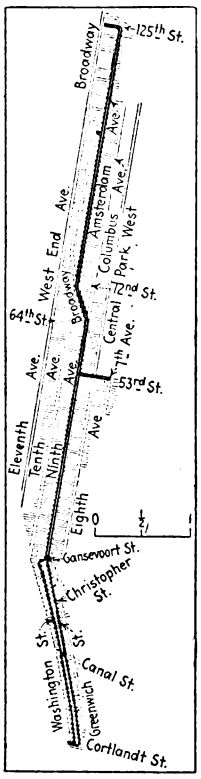
Digitized by Google

In 1921 ten persons were killed and twelve injured at grade crossings of the Long Island Railroad. In addition, more than 300 crossing gates, or one nearly every day of the year, were broken by reckless drivers in disregard of warning signs. It is probable that the fatal accidents on Long Island would have been materially greater if several years ago the management of the company had not inaugurated a campaign to keep before the people of Long Island the necessity of exercising reasonable care at grade crossings.

Ninth Avenue Railroad Converted to One-Man Operation

Among the Many Improvements on This North and South Line on the West Side of New York Is Complete Conversion to One-Man Operation—The Service Is Growing in Popularity

BY ORDER of the court in 1919 the receiver of the New York Railways Company surrendered two of its important leased lines to their owners. The Ninth Avenue Railroad, with a length of 18 miles in single track equivalent, was returned on Oct. 1, 1919, just two months after the Eighth Avenue Railroad was returned. The financial interests controlling these two properties have always been to a considerable extent the same, and both are now being operated by W. B. Yereance, who is general manager and chief engineer of both companies.



MAP OF THE NINTH AVENUE RAILWAY

The lines of the Ninth Avenue Railroad extend from Cortlandt Street ferry northward along Washington and Greenwich Streets and Ninth Avenue to Sixty-fifth Street, then up Broadway to Seventy-second Street, then north on Amsterdam Avenue to an extension of West 125th Street called Lasalle Street, then west one block to Broadway. While under lease to the New York Railways, the Ninth Avenue cars ran only as far north as Fifty-third Street, and the service on the northern part of the line was furnished by New York Railways cars, which south of Fifty-third Street ran on Broadway or Sixth Avenue. This latter service, of course, has now stopped and has been replaced by a complete Ninth Avenue service.

The territory served is of a somewhat varied character. The upper part, or that north of about Seventieth Street, is largely an apartment house and high-class family hotel district with small but high-grade shops. Farther south are, successively, shops and apartment houses of lower grade, a very extensive manufacturing district; then, on the lower section, a wholesale warehouse and market district.

At present the schedule north of Fifty-third Street calls for a headway of two and one-half minutes and that south of five minutes. This is produced by the operation of two main routes. The first is from the northern terminal to the corner of Fifty-third Street and Ninth Avenue, then on the Fifty-third Street branch to Seventh Avenue. The second route is from 116th Street (Columbia University) south, the cars going alternately to Gansevoort Street and to Canal Street, where the cars turn north again.

Owing to the great amount of street congestion south of Canal Street it was thought better to put on a loop service on that end of the line so that interruptions to the traffic there would not throw out the schedule north of Canal Street, especially on Amsterdam Avenue, where a good short-haul business has been developed.

One-man operation was begun in the latter part of March, 1922, on the 125th Street-Seventh Avenue line and now has been extended to the entire line.

The cars are the same as those formerly used with two men and are equipped with folding doors and have no bulkheads. As these cars are the first one-man cars on the west side of New York, it took some time to educate the public to their use, especially as during the transition period there were both two-man and one-man cars on the Ninth Avenue line. Each car, however, carried a large translucent "Entrance" sign on the right-hand window of the front vestibule directly over the destination sign. Removable iron shutters were provided to cover these "Entrance" signs when the car was run by a two-man crew during the transition period. When not needed these shutters were removed and placed in a spare pocket of the destination sign box.

The conductor's day card was simplified, and the men, most of whom were motormen under the old two-man operation, have become quite expert in making change. At the outset the one-man operation was slow and line headways were seriously irregular. Each week has seen an improvement in the skill of operators and also co-operation of the public, who have rapidly learned to (1) stand at the proper point to board the car without delay, (2) have exact fare ready (instead of the majority requesting change as heretofore, now not 10 per cent of the passengers request change and then usually for but a dime, although sometimes a $5 or $10 bill is tendered) and (3) pass back into the car so as to leave the forward aisle and platform clear.

Before the inauguration of the one-man service was attempted window display cards gave notice of the change and solicited the co-operation of the public. Patrons as well as operators have done their part and now the road is running practically as satisfactorily as before the change. Accompanying the change and for the reasons cited, a perceptible drop in earnings was experienced. This, however, is now being gradually overcome.

Shop Statistics

SHOPS operated by electric railway companies number 624 and represent $92,057,905 of capital, according to a report just made to the Senate finance committee by the Bureau of the Census. When the 1919 census was taken these plants had salary and wage payments totaling $42,052,521. Officers, superintendents, managers and other salaried employees totaled 1,847. A total of 53,830 hp. was employed. The value of products in 1919 amounted to $75,210,701.

Seven establishments, with an invested capital of $17,306,485, are engaged in the manufacture of cars for electric railroads. When the 1919 census was taken these plants had salary and wage payments totaling $4,984,941 annually. The value of products is given as $18,441,976.

Mechanical Division of A. R. A. Meets in Atlantic City

Reports and Recommendations of Committees on Car Wheels, Brake Shoe and Brake Beam Equipment and on Specifications and Tests for Materials Were Among Those Presented

AT THE convention of Division 5, Mechanical, American Railway Association, held in Atlantic City on June 14-21, reports were presented by the various committees. Several of these are of interest to electric railways and these are abstracted in the following paragraphs:

In the report of the committee on car wheels recommendations were made to clarify the matter of condemning limits for steel and steel-tired wheels. In 1920 the contour of the back of flange of steel and steel-tired wheels adopted in 1912 was withdrawn from the standards and the 1909 contour readopted as standard. With the 1912 contour the back of the flange of steel and steel-tired wheels was identical with that of cast-iron wheels between the base line and the top of flange. The change to the 1909 contour reduced the width of the rim from 5 1/16 in. to 5 1/2 in., and the backs of the flanges of steel and steel-tired wheels are not now identical with those of cast-iron wheels between the base line and a point approximately 1/2 in. above same.

Due to the above difference this year's committee recommended that the drawing of the maximum and minimum flange thickness gages for cast-iron solid steel and steel-tired wheels be changed to show the height of the surface which comes in contact with the back of flange to be 5/8 in. instead of 3/4 in. With dimensions as at present, these gages will not correctly indicate the condemning limits for maximum and minimum flanges of steel and steel-tired wheels. The proposed change will have no effect whatever as concerns cast-iron wheels.

An important factor in increasing the life of wheels is to pair and mount on the same axles wheels of as nearly as possible similar physical characteristics. This year's committee considered the question of attempting to mate wheels of equal hardness but reached the conclusion that the only practicable method of doing this is in the case of solid wrought carbon steel wheels to mate them within a 0.05 per cent carbon content range, and in the case of cast-iron wheels to mate by tape sizes as already provided for in the recommended practice for mounting wheels.

In presenting the report, W. C. A. Henry, chairman, said that prior to the issuance by the Bureau of Locomotive Inspection of limits of wear as adopted by the M. C. B. Association in 1909, various railroads established their own limits, some of which permitted greater wear than those now in effect. One railroad conducted laboratory tests which indicated that rolled steel wheels are of ample strength to permit greater wear than the test limits allow. The committee was of the opinion that solid rolled steel wheels confined to switching service may, with perfect safety, be worn to the limit of wear groove instead of 1/4 in. above it, which is the present condemning limit for all classes of service. If this change were made a very substantial saving would result.

In discussing the report C. T. Ripley of the Atchison, Topeka & Santa Fé Railroad said that if it is safe to use a rolled steel wheel with 1/4 in. more wear in service, it would mean a saving of hundreds of thousands of dollars to our railroads. Indications from laboratory tests and observations in service shows that railroads have not gone as low on rolled steel wheels as they should. The limit of wear on rolled steel wheels is governed by the distance from the throat to the underside of the rim on the back. At this point a sharp corner is encountered which tends to make breakage improbable. With a full radius at this point, there is a 1 3/4 in. limit. This does not seem fair to the rolled steel wheels. The general feeling is that the failure of a flange on a rolled steel wheel is not due to the tread being thin or this dimension being down to 1 3/8 in., but is due to a defect in the wheel.

James Hall of the Southern Pacific Railroad submitted a gage for consideration and in discussing this said that there is another point to be considered when gaging worn wheels. There is a condemning limit of 1 3/8 in. of metal through the throat of the flange taken at the back for inner face of the wheel. It has been found that the critical line at the front or outside face of the wheel and that at the back or inside face do not in all cases coincide, and while a wheel might have the required amount of metal at the outside, it may have reached the limit of wear of 1 3/8 in. at the back or inside, which might be overlooked. The gage submitted provided for that, the tail of the gage which extends along the back of the wheel being graduated and a scrap limit mark provided. These graduations are not intended to give the exact amount of metal through the throat of the flange, but merely to act as a precaution against going below the 1 3/8 in. scrap limit. The gage is also provided with an attachment for determining the amount of metal necessary to remove from the treads in order to restore contour. The graduation indicates to a sixteenth of an inch the depth of cut taken.

O. C. Cromwell of the Baltimore & Ohio Railroad said that many times one of a pair of wheels is worn to a thin flange while the other has a relatively thick flange. With that condition only half the mileage is obtained that would result if the two flanges were worn an equal amount. Uniformity of carbon content assists in giving the wheels more nearly the same hardness and results in a more even wear of the flange. In regard to reducing the limit of wear, in line with the limit of wear grooves, the figure of 1 3/8 in. was established on the line of steel-tired wheels as the only basis with which this could be measured and in those cases the underside of the rim was cut or turned to give about 1/4 in. less metal than with rolled steel wheels which are slightly tapered on the underside of the tread.

J. A. Pilcher said that the Norfolk & Western Railway was conducting a series of experiments in regard to running the wheels thinner. It has run wheels safely 1/4 in. thinner than the limit set.

A motion to accept the report was put to a vote and carried.

The committee on brakeshoe and brake beam equipment made a study of brakeshoe construction and as a result recommended a design of steel back brakeshoe to letter ballot as recommended practice as the best that the committee could develop which is not covered by patents.

A canvass was made of the situation regarding brake shoe keys, and as a result the committee recommended the lengthening of the head from 1/2 in. to 1 in. and bending it over instead of upsetting it.

In the discussion following the report brake-beam reclamation was taken up. E. L. Burton of the New York Central Railroad said that in line with the committee's suggestion of last year, the New York Central had recently tested a large number of beams that had been reclaimed in its shop and almost without exception these beams failed to meet the test requirements. A large number of second-hand beams were returned to the manufacturer who made the necessary repairs. These beams were then subjected to the same tests as called for on the specifications for the new beams and almost without exception they passed the requirements.

G. G. Juneau of the Chicago, Milwaukee & St. Paul Railroad said that the specifications for brake beams should be just as rigid for the reclaimed beams as for the new beams.

A motion to accept the report and submit it to letter ballot was carried.

In the report of the committee on specifications and tests for materials a revision was made in the standard specifications for air brake and train air signal hose as follows:

"15. Label. Each length of hose shall have vulcanized on it a label of red rubber. This label shall be applied on the hose at a point 6 in. from the end (a variation of 1/2 in. either way will be permitted) and with the top of the lettering toward the center of the hose. The use of a rectangular label in addition to the band label is optional with any railroad providing space,

Digitized by Google

preferably 2 in., is allowed between the two labels."

Revisions of recommended practice specifications were also made as follows:

(a) Specifications for turpentine to be revised as shown in Exhibit B, proposed form.

(b) Specifications for oxide of iron paste to be revised as shown in Exhibit C, proposed form.

(c) Specifications for black paint to be revised as shown in Exhibit D, proposed form.

(d) Specifications for raw linseed oil to be revised as shown in Exhibit F, proposed form.

(e) Specifications for boiled linseed oil to be revised as shown in Exhibit F, proposed form.

(f) Specifications for red lead to be revised as shown in Exhibit G, proposed form.

New recommended practice specifications were also recommended for submission to letter ballot by the association as follows:

(a) Specifications for mineral spirits as shown in Exhibit H.

(b) Specifications for red lead and oil as shown in Exhibit I.

(c) Specifications for extended red lead paste paint as shown in Exhibit J.

In discussing the report of the committee on specifications and tests for materials, H. F. Bentley of the Chicago & Northwestern Railroad said that he had found a large number of axle failures were due to the impression left by a sharp pointed tool in the roughing cut rather than to the kind of steel used in the axle. In investigating troubles experienced by his road, he found that on etching the broken parts there was indication that an original check had been made in the bearing of the axles by a pointed diamond shaped tool. Subsequent operation on this bearing through the rolling to a smooth finish had covered up the grooves and to all appearances the axle had an excellent finish. Through the assistance of Dr. Howard, engineer of the Interstate Commerce Commission, it was proved conclusively that the initial start of the fractures on the majority of the axles was due not to the quality of the steel but to the tool impression left.

G. W. Rink of the Central Railroad of New Jersey said that the question of heat-treated axles has not been fully settled as yet. In connection with a recent order Mr. Rink said he was surprised to learn that those engaged in doing the heat treating did not recommend heat-treated material for that purpose. They predicted all sorts of calamities and stated that a greater number of broken axles would result.

W. F. Kiesel, Jr., of the Pennsylvania Railroad said that they had used a large number of heat-treated axles, crank pins and other parts and in studying difficulties experienced, had found that a nick or a sharp corner was almost certain to start a detailed fracture. He recited one case where a radius between the wheel seat and the body of the axle was not clearly defined on the drawing. Some of the radii seemed about ¼ in. and the fracture started at this point. The radius was increased to 1 in. and half of the fractures ceased.

The report of the committee was approved for submission to letter ballot.

Pacific Claim Agents Meet

In Three-Day Session They Discuss Railway Claims and Accident Reduction Problems

PLEDGING renewed efforts to accident prevention, claim agents and attorneys of every electric railway on the Pacific Coast attended the thirteenth annual convention of the Pacific Claim Agents' Association in Los Angeles, June 7, 8, and 9.

C. M. McRoberts, general claim agent of the Los Angeles Railway, was chosen president at the annual election and will preside over the 1923 session to be held in Portland, Oregon. Other officers elected are: S. A. Bishop, general claim agent Pacific Electric Railway, Los Angeles, first vice-president; P. O. Solon, claims attorney San Francisco-Oakland Terminal Railways, second vice-president; B. F. Boynton, claim agent Portland Railway, Light & Power Company, secretary-treasurer.

The convention was called to order on Wednesday morning, June 7, by Frank D. Oakley, attorney for the Tacoma Railway & Power Company, who served as president during 1921 and 1922. D. W. Pontius, vice-president and general manager Pacific Electric Railway, made the address of welcome, which was responded to by the president.

After disposing of business affairs at the morning session, the afternoon meeting was opened with a talk by R. C. Gortner, trial attorney for the Pacific Electric Railway on "Liability in Claims Involved in Joint Enterprise or Venture." The remainder of the afternoon was devoted to discussion of subrogated claims. Under California law a passenger in an automobile driven by a second party may recover damages either from the driver of the machine in which he was riding or the railway or owner of any other vehicle with which the first machine might be in a collision, regardless of where the responsibility rested. The organization went on record as favoring widening the scope of imputable negligence in such cases. Steps will be taken to bring the need for such action before the California Legislature.

At the morning session, June 8, Thomas G. Aston, Washington Water Power Company, of Spokane, spoke on "Medical Testimony in Litigated Cases." He said that claim attorneys are apt to get the attention of a jury away from the main facts of an accident by delving into involved medical testimony. He declared that chief attention should be given to the actual facts of the accident.

J. H. Handlon of the Market Street Railway, San Francisco, discussed methods followed by that railway to promote close co-operation between trainmen and the claims department. The Market Street Railway sent to all trainmen a questionnaire asking what phase of accident reports and the securing of witnesses presented the greatest difficulties. By this means the officials were able to give detailed instruction on particularly vital points.

F. G. Furman of the Butte (Mont.) Electric Railway spoke on "The Technique of Trials," in which he discussed matters of selecting juries and presenting evidence.

The entire afternoon session, June 8, was devoted to safety discussions. S. A. Bishop took as his topic "The Ever-Increasing Automobile Accident." He advocated state examination of applicants for automobile drivers' certificates. This proposition is to be brought before the California Legislature at the next session by the Automobile Club of Southern California. The benefit of safety campaigns was discussed by H. K. Relf of the Spokane, Portland & Seattle Railway and H. G. Winsor of the Tacoma Railway & Power Company. The papers reviewed the history of accident prevention work on the Pacific Coast. The use of house organs was mentioned as a particularly beneficial way of reaching trainmen during accident prevention campaigns.

At the final session Friday morning, the following subjects were discussed: Accidents occurring at amusement parks, new methods of obtaining co-operation of trainmen with claim departments, advising operating departments of negligence and their costs, the Texas barratry acts, the advisability of offering a cash bonus to trainmen for freedom from accidents, and whether it is better after a serious accident in which a trainman was negligent to discharge him or to retain him in service at least until the case has been settled.

A resolution was passed that the association bring to the attention of coast legislatures the need for a law similar to the Texas barratry act, which is directed against the so-called ambulance chasers and makes it a misdemeanor for any one to solicit for his own profit employment in handling an accident damage claim for plaintiff or defendant when no personal interest in the case exists.

Co-operation with the American Railway Association in its grade crossing safety campaign was pledged. The slogan "Cross Crossings Cautiously" will be used extensively until Sept. 30.

The delegates were entertained June 7 by the Los Angeles Railway at a dinner in the Ambassador Hotel. Thursday evening a moonlight trolley trip to Mount Lowe was arranged by the Pacific Electric. Saturday morning the Pacific Electric took the claim agents and their wives to Riverside for lunch at the Glenwood Mission Inn.

On telegraphic invitation from President F. T. Griffith of the Portland Railway, Light & Power Company, the association decided to hold the 1923 convention at Portland, Ore.

Duties of a Claim Agent*

Analysis of What a Claim Agent Can Do to Further the Interests of His Employers

BY J. H. HANDLON
Claim Agent Market Street Railway, San Francisco, Cal.

IN FORMER years claim agents considered that they were doing all that their employers could reasonably expect of them when they put forth every effort to safeguard claim department expenditures. Subsequently there developed almost a concerted movement to prevent accidents. Claim agents were often found heading these safety first movements, and if not they were well at the forefront because they saw the need of doing all they could toward preventing accidents.

Every conscientious claim agent, and they are a conscientious body of men, has again and again asked himself "What can I do more to benefit the company employing me?"

We will assume that such a claim agent fortifies himself with facts and figures relative to the claims department expenditures and claims department operations of other companies, that he compares such data with the records of his own company in the hope of detecting weakness in his own organization or lack of efficiency within himself or his associates.

If he is far-seeing he has also compiled at regular intervals statistics to guide the conduct of affairs of his own department and to disclose any defects of the operating department, ever bearing in mind that it is unwise to be a self-appointed critic of the operating officials if this should cause a lack of co-operation between the two departments to the company's detriment.

There is a factor that confronts claim agents which does not ordinarily present itself to those battling with other problems, for since there is no well-defined method of measuring the value or lack of value of a claim, the claim agent should not permit himself to be subject to prejudice, weak, changeable or stubborn.

An unusually large number of rejected claims might reveal that a claim agent's disposition has become soured by an unjust verdict, or bitter toward all claimants because he was deceived by an unscrupulous claimant. On the other hand, a vast increase in the proportion of claims allowed might disclose listlessness or apathy which he should correct. The only way to mirror our actions is to contrast the results of our work from time to time, and that can only be done by compiling comparative, statistical information.

I like to compare the functions of a claim agent with those of a safety valve, for both prevent destruction and waste and neither can relinquish responsibility for one moment.

Some claim agents deem it their duty to assist in the selection and training of the men on the cars, and they maintain a follow-up system of keeping trainmen enthusiastic over their accident prevention work. They also busy themselves in civic or club or lodge affairs in the hope of advancing the prestige of their companies, and the further object of seeking an opportunity to obtain recognition in their own communities as upright, representative citizens whose word is of value.

Many claim agents have adopted a code of ethics which does not permit them to settle a claim unless with honor. Such claim agents endeavor to inject the same spirit of fairness into the actions of every one connected with the claims department.

I have heard it contended that claim agents should make a minute study of the law of negligence as well as about all classes of injury and up-to-date surgical methods so that they may more intelligently determine the question of liability and the extent of the injury. While it is well to have a working knowledge of law and medicine, I believe that there is truth in the old adage that "a little learning is a dangerous thing." A claim agent who makes a close study of such subjects is disposed to pride himself upon his superior knowledge and therefore often loses his sense of perspective. It is far better for the claim agent to be guided by expert legal and medical advice supplemented by his own knowledge and experience.

Something more might be accomplished by the average claim agent if he should devote a portion of his time and energy to such matters as:

1. Assisting the operating department in enforcing discipline by reporting all infractions of rules and instances of carelessness or negligence that come to his knowledge.

2. Co-operating with the transportation department in its efforts to reduce the turnover of platform men by doing everything possible to create a more pleasant environment for trainmen, for we all realize that the newly employed trainman is more subject to accidents than the experienced man.

3. Keeping the operating department supplied with safety literature and safety data, not only that they may learn what is being done elsewhere in accident prevention work but with a view of preventing the trainmen from lapsing into carelessness. This to supplement the work of the safety committee where such organization exists.

4. Devising safety rules and suggestions for the operating department, many of which would occur to the claim agent as a result of the investigations he has made of accident causes.

5. Informing ourselves as claim agents of the problems of the company that we may educate others to a better realization of what our employers are doing for the community.

6. Encouraging a better feeling between employees and employer whenever an opportunity presents itself.

7. Establishing various channels of information between all company departments and the claim department with a view of facilitating the gathering of knowledge that would prove of value in the handling of claims, as often company employees learn facts from outside sources that could be used by the claim agent to advantage.

8. Devoting a portion of our time as claim agents to enforcing collections for damage to company property, even extending whatever work we have been doing in that direction in the past and especially since the insurance companies are becoming more and more insistent that the transportation companies should, through subrogation, bear a portion of their losses.

*Abstract of paper presented at the thirteenth annual convention of the Pacific Claim Agents' Association, Los Angeles, Cal., June 7, 1922.

Engineering Educators in Session

AS THIS issue of the JOURNAL goes to press the Society for the Promotion of Engineering Education is in session at the University of Illinois, Urbana, Ill. After a stirring address by President Charles F. Scott, formerly chief consulting engineer Westinghouse Electric & Manufacturing Company and now professor of electrical engineering at Yale, in which he traced the parallel development of university education and the economic trend in industry, the following resolution was passed:

"Whereas, the president of this society, visioning the future, has after a careful study of the possibilities of greatly enlarging the scope of its activities made certain recommendations and whereas in his opinion there is a reasonable possibility of securing funds for the Society for the Promotion of Engineering Education if an adequate plan is developed and indorsed by this society, and

"Whereas the president of this socicil, this society stands challenged by the conditions thus presented, now be it

"*Resolved*, That the president of this society appoint a committee of five members, including himself, to study the development of the society for the promotion of engineering education and to formulate an answer to the question 'What can the society do in a comprehensive way to develop, broaden and enrich engineering education,' and further that this committee shall report, as early as feasible, formulations of an answer back to the council for action on the committee's recommendations."

The keynote of all discussions at the sessions of the society was the development of teachers who can train engineers, with analysis of the plans that are now being studied to make university training more effective.

Prof. C. F. Scott was re-elected president, and among the directors elected was M. W. Alexander of the National Industrial Conference Board.

The Modern Railway Motor*

By J. K. Stotz,
Canadian Westinghouse Company, Hamilton, Ont.

THE first commercial railway motors were built in the '80s. Vandepoele, Henry Daft, Bentley, Knight, Short and Sprague were the men prominent in the development at this time. These old motors were of the double reduction gear type because of the low car speed and the high motor speed considered necessary at that time. The first single reduction motor was put on the market in the spring of 1891. The Westinghouse motor was the No. 3. After the No. 3 came the 12 and 12-A, the 38 and 49. The G.E. 800 and 1,200 were developed in this same period.

Commutating poles were introduced in 1907 and 1908 and in 1915 and 1916 the light-weight idea hit the railway field. Car bodies, trucks and electrical equipment were cut to the bone. The low-floor car appeared due to the demand for lightweight and to women's skirts. This meant small wheels, small motors, more power in the same or less space. The result was the ventilated motor with a fan on the shaft for the circulation of air through it. The use of the fan increased ratings and hence the current densities at which it was possible to work the copper. This was a real gain and its benefit has been retained in our present designs.

The speed curves of the modern motors tend to be steep. There is some argument as the relative value of steep and flat speed curves, but in most applications the steep curve seems to have the better of it. In these days of automobile traffic, the car that can pick up and go when it has a clear track is most in demand. Rapid acceleration and high balancing speed with low power consumption are the ideals usually sought. Power consumption is less for a given car speed, or for the same power consumption a higher speed may be obtained with a steep curve.

A steep speed curve means a motor with relatively low saturation. To get this and keep light weight means the use of the best magnetic materials. Laminated cores built up of thin japanned punchings have long been standard. Poles are made of thicker laminations, bolted to cast-steel frames. Air gaps are made as small as mechanical considerations and speed requirements will permit. Field control is coming into increasing favor on many applications where the power saving due to it is large.

Railway motor ratings are more or less fictitious in that they do not represent the power that the motor will develop under operating conditions. Because of the nature of the motor load, this would not be possible. The ratings that we give a motor are a short time rating, which is a measure of the thermal or heat storage capacity of the machine, and a continuous rating, which is an indication of its ability to dissipate heat continuously.

With the old non-ventilated motor these two ratings had a fairly definite relation to each other: for instance, on the 101-B-2 the continuous amperes at 300 volts were 35 or 49 per cent of 72 amp. the one-hour current at 500 volts. But the advent of the ventilated motor upset this ratio. The one-hour rating stayed about where it was but the continuous rating was increased, until it was from 60 to 70 per cent of the one-hour current. In other words, for the same continuous rating, the overload capacity, as measured by the hour rating, was reduced. This was not thoroughly realized at first and resulted in some misapplications of equipment and much abuse by the operator who was accustomed to using his cars for bucking snow, hauling in dead cars and generally performing any emergency service that might come along.

Most operating men have learned by now that motor ratings are not what they used to be, and while they are getting more, much more, out of every pound of motor than they did ten years ago, they realize that there is a very definite limit to overload capacity on this modern motor and it cannot be exceeded without leading to trouble. As the effects of short overloads are better understood and appreciated by the operator, troubles from this source will decrease. Of course, there will always be roasted equipment. The road must operate "whether or no," and if the motors are overloaded in an emergency it cannot be helped for cars must be kept running at any cost. At least that's what the transportation departments say, and all the master mechanics can do is hire more armature winders.

Type	Motor Number	Weight (Lb.)	1 Hour Amp. 100 Lb.	450 Volts Continuous Amp. 100 Lb.	Ratio of Cont. to 1 Hr. Amp. 100 Lb.
					Per cent.
Ventilated Commutating-pole	508A	1,035	4.63	3.38	73
	514-A	1,650	3.64	2.18	60
	533-T	2,300	3.22	1.95	60.5
	306-CV-4	2,700	3.48	2.22	64
	557-A-8	4,050	5.0	3.33	67
	577-A-6	5,650	4.75	3.19	67
Non-ventilated Non-commutating-pole	12-A	2,200	2.14	.87	40.5
	38-B	2,400	3.34	1.29	28.6
	68	2,280	3.11	1.32	42.5
	101-B-2	2,780	2.59	1.15	44.4
	112-B	3,485	3.7	1.32	35.7
	121-A	4,300	3.38	1.56	46.2

The greatest developments of recent years in any motors have been in the improvement of the mechanical features, insulation and manufacturing processes. Most armature shafts now are made from heat-treated or alloy steels. Their design has been improved as our knowledge of the fatigue of metals increases. Fillets are made as large as possible and abrupt changes of section avoided so as to prevent localizing of the strain caused by the alternating bending movement produced by the pinion. We feel that the design of shaft will give very much less trouble due to bending and breakage than the old axle steel type.

Depending upon the size of the motor, armature cores are built either directly on the shaft or on a spider into which the shaft is pressed. The tendency seems to be away from spider construction except in the larger motors. The cores are built of a mild steel of high magnetic permeability insulated by Japan varnish. To prevent the core from spreading at the ends, end punchings of heavy $\frac{1}{8}$-in. steel laminations are used. To stiffen these still more the teeth of two punchings are spot welded together. Two or three of these are used at each end of the core, thus forming a very stiff construction which effectually prevents spreading of the punchings. Ample radii are used in the corners of the slots to reduce danger of teeth breaking due to vibration. The core is held between end plates pressed on the shaft. These end plates also serve as coil supports.

Armature coils must be properly shaped to wind easily, be accurately sized to fit the slots and fill the end space properly so that they will not vibrate, and must be insulated to stand the voltages and temperatures under which they are to operate. These conditions are met by using form wound or properly pulled coils, by pressing the slot portion accurately to size and by using every precaution in manufacture and taking advantage of every development in insulation. Railway motor coils are subjected to extreme vibration and abuse so that their insulation must be mechanically strong. Fish paper strips between turns and layers to prevent short circuits between wires are freely used. Extra taping or insulation is applied wherever strain or abrasion is concentrated.

The temperatures at which railway motors operate require the highest grade of heat-resisting material. Unfortunately, resistance to heat and insulating qualities are seldom combined with mechanical strength and resistance to moisture. The resultant insulation is a compromise, which represents the best that we can do with our present knowledge of insulating materials.

The first ventilated motors had small fans slightly larger in diameter than the armature core. A baffle extended from the frame to within a short distance of the armature in front of the fan. Air entered the motor in front of this baffle through openings in the frame, passed over the field coils and commutator to the front of the motor and was drawn through longitudinal ducts in the armature core, and under the end windings to the fan, whence it was discharged from the motor through another set of openings in the frame. This method of cooling is known as

*Abstract of paper read at the annual convention of the Canadian Electric Railway Association, Quebec, June 1 to 3, 1922.

Digitized by Google

"series ventilation," because the fields and armature are cooled successively, and in the climatic conditions prevailing in Canada has demonstrated its effectiveness.

The next step was to make the fan larger in diameter, remove the baffle or enlarge its diameter to that of the fan, close the intakes at the rear of the frame and provide openings at the front for the air to enter by. This scheme is known as "parallel ventilation," because two parallel streams of air pass over the field and armature. In this Canadian territory, inclosing covers are necessary during the winter season to keep out fine snow or slush.

The fan passed from the small diameter one-piece casting, shrunk on the shaft, through the large diameter with plates riveted on the sides to control the air paths to the type where these plates were replaced by a ring cast integral with the fan to the present design of a dish with blades projecting from it, cast in one piece from steel.

Improvements in brush-holder construction have been toward the elimination of moving parts and the reduction of inertia of those remaining. Simplicity in design, as far as consistent with proper functioning, has been the ideal. Higher brush pressures have been made necessary in some cases by the condition of roadbed and equipment. The method of applying the insulating porcelains has been improved so that loose porcelains are becoming scarce.

Recent improvements in housings have been to make them generally stronger. The use of cast steel instead of malleable iron is increasing. Oil catching devices have been improved so that the danger of oil reaching the windings has been reduced.

The axle caps, especially the pinion end, are subjected to extreme vibration and pounding. As a result, it is necessary to be continually tightening the bolts on the caps. When tap bolts are used they soon strip the threads in the frame casting under this treatment. For this reason the design of frame and axle caps has been toward the elimination of tap bolts and the use of all through bolts wherever possible. We feel that in so far as casting difficulties and other design limitations will permit, we should have all through bolts on all our modern motors.

Axle bearing lubrication and design is much like armature bearing, except that the bearing is split and cannot be held in place by its fit. Dowels, either radial or axial, are used and both give more or less trouble. The latest development in this line is a combination of both. This consists of two axial dowels engaging holes in the flange of the bearing, and a third radial dowel entering the bearing at the rear between the window and the end. Clearances in the holes are made such that the bearing may be slipped over the axial dowels and then dropped onto the radial, even though they are at right angles to each other.

Helical gears are increasing rapidly in their application and are operating very successfully under all conditions of service. The use of helical gears reduces noise and vibration to a very great extent. This results in a great reduction in the troubles caused by vibration. Broken leads, loose punchings, bad commutation and various other troubles are reduced or eliminated by the use of the helical gear.

The principle of operation of the helical gear is well known by now. We may consider a helical gear as made up of a number of spur gears, each shifted around the circumference by a small amount. When the number of spur gears is small we get what is known as a stepped gear. When the number becomes large so that the advance in the adjacent tooth approaches a smooth curve we get a helical gear. Instead of a gear tooth entering into contact across the entire face at once, the contact begins at one edge of the tooth and travels progressively across the face. This reduces the shock due to the sudden transfer of the entire tooth load from one tooth to the next such as we have with spur gears.

One objection that has been raised to the use of helical gears is that the end thrust developed will cause excessive flange wear of the armature bearings. On a 7½-deg. helix, such as is used on our helical gears, the end thrust does not exceed 13 per cent of the total tooth load and, due to sliding friction between the teeth in the direction of the thrust, it is found to be somewhat less than this in actual practice. Actual results of operation on many properties where helical gears are used show that the end wear is no greater on motors fitted with helical gears than on those having spur gears on the same type of cars in the same service.

Electrically, the modern railway motor represents as much capacity per pound as it is possible to give with present materials and giving due consideration to the necessity of producing a motor that will stand up mechanically under the very severe service and frequent abuse to which it is subjected in the railway field. We believe that there is no piece of apparatus which receives as much abuse and is as well able to stand it as the modern railway motor.

American Construction Council Organized

FRANKLIN D. ROOSEVELT, formerly Assistant Secretary of the Navy, was elected president of the American Construction Council on June 20 at the end of a two days session held in Washington, at which leaders of the construction industry gathered to organize a body representative of all construction elements. John B. Larner, vice-president of the American Bankers' Association and president of the Washington Loan & Trust Company, was elected treasurer.

During the two days session just concluded, 200 architects, engineers, general contractors, sub-contractors, construction labor, material and equipment manufacturers and dealers, financial, bond, insurance and real estate interests, public utility construction departments, federal, state, county and municipal associations have been meeting to consider what can be done to put the construction industry as a whole on a higher plane and to determine ways and means of working together to that end.

The immediate program of action will be in the hands of the officers and an executive committee made up of representatives of the different interests concerned. Those members of the committee representing public utility construction are: Gano Dunn, New York; Francis Blossom, New York; Joseph H. Alexander, Cleveland, and C. H. Markam, Chicago. The engineers are represented by Charles T. Main, Boston; Peter Junkersfeld, New York; Bion J. Arnold and Charles F. Loweth, Chicago.

American Association News

Recent Engineering Association Committee Activities

AS JULY 1 approaches, the date when committee reports are due to be in the hands of Executive Secretary J. W. Welsh, committees are meeting to put the finishing touches upon their year's work. Among meetings held within the past few weeks were those of the committees on way matters, power distribution, equipment and heavy traction, all of the Engineering Association.

Way Matters

The committee on way matters met in Quebec on June 1 and 2. Those present were W. F. Graves, chairman; H. H. George, E. B. Entwisle, E. M. T. Ryder, J. H. Haylow, C. F. Gailor, W. W. Wysor and H. Fort Flowers.

The committee voted to approve the action of the previous meeting in disapproving the plan for the standardization of frogs for double-track branch-offs shown in Appendix "A" of the 1921 report, as in the opinion of the committee it does not have sufficient advantages to warrant its adoption as recommended practice.

Mr. Ryder submitted for Mr. Angerer blue prints of plans for three standard car-clearance easements. Two of these the committee decided to recommend for adoption at the coming convention, and the third it recommended be referred to the 1923 committee for further study.

The committee reached the conclusion that no further progress could be made on the subjects of curved contours for new wheels and design of wheel treads and flange contours as at present assigned, and voted to recommend to

Digitized by Google

the executive committee that a special committee representing all interests be appointed to study the subject further.

Mr. Wysor, chairman of the subcommittee on arc-welded joints, submitted a drawing of the proposed rotary testing machine for welded joints, and several suggested plans for financing the construction, installation, and operation of this machine were discussed at length. (A preliminary statement regarding this machine, with illustrations, appeared in the June 17 issue of this paper.)

The final report of Mr. Wysor's subcommittee was also approved for inclusion in the way committee's report, with Mr. Wysor's report of May 8 on the testing machine as an appendix.

The specifications for tie rods, submitted by the subcommittee on sundry track materials, were referred back to the subcommittee for revision. Other sundry track material specifications were approved and will be published in the committee's report.

The final reports of the following subcommittees were also received and approved for inclusion in the general report: Subcommittee on revision of girder rail specifications, presented by Mr. George; subcommittee on design of substitute ties, presented by Mr. Baker; subcommittee on wood preservation, presented by Mr. George; subcommittee on design of track construction in paved streets, presented by Mr. Wysor, and subcommittee on revision of existing standards, presented by Mr. George.

The committee finally voted that an expression of appreciation and thanks be extended to W. J. Lynch and R. M. Reade of the Quebec Railway, Light & Power Company for courtesies shown the committee during its visit to Quebec, which was timed to coincide with the annual convention of the Canadian Electric Railway Association

EQUIPMENT

A well-attended meeting of the Equipment Committee was held at the association headquarters, New York City, on June 1. Those present were R. H. Dalgleish, Capital Traction Company, Washington, D. C., chairman; W. S. Adams, J. G. Brill Company, Philadelphia, Pa.; H. A. Benedict, Public Service Railway, Newark, N. J.; L. J. Davis, Brooklyn (N. Y.) City Railroad; Stewart Hazlewood, Midvale Steel & Ordnance Company, Philadelphia, Pa.; J. M. Hipple, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; A. J. Miller, Association of Manufacturers of Chilled Car Wheels, Chicago, Ill.; E. D. Priest, General Electric Company, Schenectady, N. Y.; P. V. C. See, Northern Ohio Traction & Light Company, Akron, Ohio; C. W. Squier, ELECTRIC RAILWAY JOURNAL, New York, N. Y.; R. W. Steigerwalt represented C. F. W. Rys, Carnegie Steel Company, Pittsburgh, and Albert Scheer, Jr., of the Public Service Railway of New Jersey was present by invitation of the committee.

The various subcommittees made their final reports on the subjects assigned for consideration. These were discussed by the committee as a whole and the final drafts for inclusion in the committee's report were decided upon.

POWER DISTRIBUTION

The power distribution engineers met in New York City on June 6, with Chairman M. B. Rosevear and thirteen out of the other fifteen members in attendance. This was a remarkable showing as the membership is scattered over a wide area.

It was decided that subcommittee chairmen should prepare abstracts to precede the body of their reports. Mr. Rosevear asked all members to submit names of desirable men for members of next year's committee. He also requested subcommittee chairmen to submit lists of names of men to be asked to give prepared discussion of their reports at the convention.

Possibly the most important single topic discussed related to the crossing specifications and the "Safety Code." Mr. Eaton covered the subject in detail, including the proceedings of the American Engineering Standards Committee conference of March 2. (See ELECTRIC RAILWAY JOURNAL, Feb. 18, page 288; March 11, pages 393 and 414.) Mr. Harte offered also the following alternative recommendations, which were adopted, one or the other to be used, depending on the action which may be taken at the next meeting of the A.E.S.C.:

"1. If the recommendations of the March 2 conference are adopted: Pending the completion of the work of the sectional committee of the American Engineering Standards Committee, which will doubtless result in the adoption of a set of national specifications, we recommend that Manual Section Ds 1c be suspended, and that member companies follow, as a minimum, the requirements of the National Electrical Safety Code.

"2. If the vote to reconsider prevails: The fact that at that time many states were considering individual action on crossing specifications led this association in 1919, in the hope that united action by the electric and steam railway interests might serve to secure unity of action elsewhere, to accept and approve a specification not entirely satisfactory, but which it was expected would be revised as soon as the necessary evidence could be secured.

"The other parties to the specification, however, seemed unable so to proceed; many of the steam roads do not employ it, and in the various state conferences the steam roads have been unable to produce sufficient evidence in favor of its higher requirements to secure its adoption there. The failure of the proceedings before the American Engineering Standards Committee has now removed opportunity for any general harmonizing of this specification and the National Electrical Safety Code, which is now, either substantially unchanged or slightly modified, the standard of most of the states. It is recommended, therefore, that our specification Manual Ds 1c be now withdrawn as a standard, and that pending the preparation and adoption of an American Engineering Standard Crossing Specification the National Electrical Safety Code requirements be followed."

On the subjects of wood preservation and reclamation of poles, Mr. McVittie reported regarding preservation that he does not feel he has sufficient information to draw up a specification. He recommends that he draw up a report and publish therein, for information only, some of the best of the existing specifications, and that the subject be carried over another year, with a suggested line up of procedure for next year's committee. This was approved. Regarding reclamation, his report will include descriptions of various methods of reinforcement now in use.

On the subject of automatic substations, Mr. Jones described the proposed report on this subject, stating that the committee had worked up several alternate schemes for one urban problem which would be included in the report together with the general subject of the operation and control of automatic substations.

Reports from other subcommittees also showed their work to be well in hand.

HEAVY TRACTION

The heavy traction committee met in New York on June 21. Present were chairman S. Withington, L. S. Wells, A. H. Armstrong and H. W. Cope.

The committee went over a table of operating data of electrified sections of steam railroads and arranged for revision in some details. A second table of data of foreign electrifications was also studied. Much interest centered in the bibliography presented in preliminary form last year. It was decided to prepare this year a supplementary bibliography to July 1, 1922, for incorporation in the 1922 report. It will be recommended further that the complete bibliography be revised promptly and reprinted in form convenient for distribution by the association.

Coal Stock Survey Being Made

AT THE request of the Secretary of Commerce, Herbert Hoover, the American Electric Railway Association is sending out a questionnaire calling for information on the tonnage of coal on hand, storage capacity, daily requirements, amount of coal contracted for, names of contractors, grade of coal required, etc., by the electric railway companies. A similar questionnaire is being sent out by the National Electric Light Association and the American Gas Association. It is very important that all railway companies co-operate in furnishing this information to the association headquarters, so that the Secretary of Commerce may be able accurately to judge the position of the public utilities with reference to the coal strike.

East Bay Safety Council

Formed by Public Spirited Citizens and Employers in Oakland and Berkeley —Local Railway Interested

The San Francisco-Oakland Terminal Railways is taking an active interest in a recently formed East Bay Safety Council, organized in Oakland, Berkeley, Alameda and neighboring cities to reduce accidents. George H. Harris, assistant to the general manager of the railways company, is vice-chairman of the council, and E. E. Thornton, superintendent of the Key division, is secretary.

The other officers and directors of the Council include representatives of prominent manufacturing companies, chiefs of police of several of the cities covered, a district attorney, a commissioner of public health, a superintendent of schools, a president of an auto trade association, and two daily newspaper publishers. The annual dues to employers are 5 cents for each employee per year for the first 1,000 employees, and 3½ cents per employee over that number, with a minimum of $15 per year. Individual members pay dues of $6 per year. The reception to the plan of the council by the newspapers has been very favorable. An outline of the purposes, issued in the form of an appeal, was published in the "Key System News" for May 18.

The declaration of principles of the council is as follows:

ELEVEN PRINCIPLES SUMMARIZED

1. The Safety Council operates as an individual organization.
2. It is a voluntary, co-operative, non-profit-making, non-political, non-commercial organization of public spirited citizens and employers interested in promoting Public and Industrial Safety, the prevention of accidents and conservation of human life.
3. It is the purpose to co-operate with the constituted authorities in the furtherance of the principles of safety.
4. It shall be the policy of the Council not to endorse a private commercial interest or candidates for political office.
5. Any legislative matter, policy or principle in which the endorsement of the Council is requested shall be first referred to the proper committee which committee shall report its findings before the Executive Committee will take final action.
6. The Council shall constantly strive to impress upon the community that the saving of life and lessening of cripples and orphans by reducing the causes of accidents is (first) humanitarian and (second) good business.
7. The Council has as its object, the reduction of accidents and fatalities in industry and on the streets by creating an atmosphere of safety and of better co-operation between the pedestrian and the driver of the motor vehicle, thereby effecting a great economic as well as social saving to the community.
8. The Council's program contemplates activities to be carried on through the homes, schools, churches, industries, railroads, public utilities, civic organizations and other agencies in this manner developing community interest in the prevention of injury and death, the avoidance of fire waste and promotion of health.
9. The Council has as one of its principal elements of work the education of the children in the schools to be safe and to help to overcome the hazards of our streets.
10. The Council endeavors to secure co-operation between the police, the courts, the public; obtaining better laws and proper enforcement of existing laws and regulations affecting traffic conditions on the streets, vitally necessary to a safe community.
11. The Council dedicates itself to the proposition that it is safer to think first than to suffer afterward, hence it seeks to eliminate accidents and fire hazards by inculcating through propaganda and instruction, this important feature of Safety Work in the mind of every man, woman and child.

No Irregularities Among Legislators

The Suffolk County Grand Jury has investigated the passage of the public control act governing the operation of the Boston (Mass.) Elevated Railway under the auspices of the State and reports that there is no evidence of irregularities warranting any indictments, but it says some of the legislators were indiscreet in their investments at the time of the passage of the act in 1918. This may end a long and bitter agitation against the operation of the road under the present arrangement with the trustees.

Recommends High-Speed Lines

In response to an invitation of Mayor Moore at the suggestion of the Chamber of Commerce to discuss transit extensions Thomas E. Mitten, president of the Philadelphia (Pa.) Rapid Transit Company, urged additional high-speed and surface lines as an essential to the uninterrupted growth of the city.

In speaking of the Roosevelt Boulevard line as a real need, he said in part:

Roosevelt Boulevard line, together with all other city-planned high-speed and surface lines, will not, at first, earn sufficient to pay operating costs. The city at large, the abutting property holder and the city's taxable values will secure great advantage from added transit.

What P. R. T. is able to accomplish will be largely measured by the degree of co-operation which it receives from the city in making its planned economies effective, and by the amount of return which it would be required to pay on city's construction costs. The city, by use of its credit and with practically no loss in borrowing power, could finance added transit, create increased taxable values, and in the end own the property made possible by use of city's credit.

Roosevelt Boulevard line will require property approximating $400,000 in value, which P. R. T. could supply, but P. R. T. cannot provide the money to build the tracks and overhead on the Roosevelt Boulevard, which would require an expenditure of approximately $1,000,000 on the part of the city.

The Mayor in concluding the conference said that he would consider the Mitten proposal in conference with the city solicitor, transit director and president of the Council. Mr. Weglein, president of the Council, stated later that service to the people would be the first consideration in the transit conferences.

Wage Scale Extended

If Stabilizing Fund Is Decreased During Next Six Months Toledo Employees Must Accept Cut

After less than two days negotiation between representatives of the platform men and the officials of the Community Traction Company, Toledo, Ohio, the present wage scale has been extended for another year with certain provisions which tend to make the men partially responsible for boosting the earnings of the company during the next six months. The scale is 45 cents an hour for the first three months, 47 cents an hour for more than three and under nine months, and 50 cents for those in service more than nine months. The proposition was made to the men that should the stabilizing fund, which is now at a little more than $127,000, not decrease during the next six months present pay would continue.

If the fund falls, however, from decreased earnings the men shall at the end of six months go back to the 1919 scale of 42, 44 and 46 cents an hour. And wages of shopmen and track workers would be cut 8 per cent on Nov. 1 if the fund falls. It is not likely that the fund will decrease as good gains have been made recently.

The men immediately brought pressure to bear upon city officials to route the buses so that they could not compete with the street railway lines.

IMPROVEMENTS PLANNED

Materials have been ordered to start work upon the track improvement program which will require the expenditure of more than $500,000 on the work mapped out for this summer. The city will pay for the repaving to be done between the rails and on this work will spend about $100,000. Although the Doherty interests are required by the terms of the service-at-cost ordinance to provide capital for these improvements, or forfeit a block of bonds, that form of financing will not be attempted at the present time. According to the ordinance that method would mean the issuance of 8 per cent preferred stock for the money. The whole matter will be carried along as floating indebtedness by the company until the security market is more favorable for marketing the preferred stock.

There is about $127,000 in the stabilizing fund which can be utilized for this purpose. Then there is nearly $70,000 in the hands of the sinking fund trustees which can be used also in paying for the work. Six per cent notes will be given for some of the materials. Commissioner W. E. Cann believes that the improvements will soon

Digitized by Google

pay for themselves in increased operating efficiency. One-man cars will be placed in operation on the Bancroft line on July 1 and others will be constructed for one-man operation in the near future. In the new wage contract the one-man cars are approved as being an inevitable step in street railway progress. The wage for operators of these cars is placed at 55 cents an hour.

In his report to the board of control covering May operations of the Community Traction Company, Commissioner Cann indicated that $11,896 had been earned as a surplus for the fare stabilizing fund and that $1,033 in interest on the bank balance had been added to bring the total to $127,325 at June 1. In addition to the regular payment of $17,708 made monthly to the sinking fund for municipal ownership of the system there was added $745 interest on bonds acquired by the sinking fund trustees and $767 interest on funds not yet invested in bonds.

Gross revenue for May was $304,412 as compared with $304,306 for April. The report shows that the decline in the number of revenue passengers from an average of 164,412 a day in April to 160,935 in May more than offset the advantage of an additional day's revenue. Operating expenses for May were $166,060 as compared with $168,425 for April. An additional allowance of $5,000 for maintenance was provided during May. During the month there were operated 646,862 car miles as compared with 620,496 car miles for the previous month. There were carried 4,990,539 revenue passengers as compared with 5,341,791 for May, 1921. This is a decrease of 351,252. In spite of this there is a surplus for May of this year as against a deficit of $56,270 for May, 1921. Daily average of revenue passengers for last month is 160,985 as against 172,316 for May of last year. Commissioner Cann said that indications so far for June are that the number of daily average revenue passengers for the month will be 162,000.

The commissioner reported that a new power contract between the Community Traction Company and the Toledo Edison Company had been disapproved by him after its submission to him last February and that with the consulting aid of Victor Phillips, Cleveland, a new contract based upon growth for the city and development of the lines had been submitted to the company. No action has been taken on the power question as yet.

Accident Prevention Meeting Arranged

A mass accident prevention meeting was scheduled by the Cleveland (Ohio) Railway for June 21 for all employees who are members of the accident prevention committee, organized several months ago. Besides the addresses and motion pictures, talks will be given to the men on accident prevention, loyalty to the company and courtesy to patrons. President J. J. Stanley will open the meeting and Joseph H. Alexander, vice-president, will preside. General Manager Emerson and Superintendent Noonan will deliver the addresses.

Following this meeting, Superintendent Noonan will conduct twenty-eight others during this month and July for employees in all departments. The men are paid for the time spent in attending these meetings, which are regarded as part of the company's business. Since Jan. 1 the boarding and alighting accidents from moving cars have been reduced almost to zero through the co-operation of the motormen and conductors in not opening the doors while the cars are in motion.

Service Cut by Power Failure

Many of the passengers on the elevated and the surface lines controlled by the Interborough Rapid Transit Company, New York, were inconvenienced on the evening of June 19 through the failure of the power supply of that company which necessitated shutting the lines down temporarily.

H. N. Latey, the Transit Commission's engineer of equipment and operation, after an investigation reported the direct cause of the breakdown was the failure of a 30,000-kw. unit in the Seventy-fourth Street power station, due to a short circuit on the collector rings, which occurred at 3.20 p. m. At the time one of the 30,000-kw. units at Seventy-fourth Street was out of service for inspection and repairs and another similar unit in the Fifty-ninth Street power station was out of service on account of reconstruction being carried on by the General Electric Company. Failure of the second unit in Seventy-fourth Street, therefore, eliminated 90,000 kw. from the power facilities ordinarily available.

Frank Hedley, president and general manager of the company, summoned to a conference with the Transit Commission to explain the service interruption, admitted that the Interborough and its allied lines will have to depend probably for two weeks or more upon the emergency equipment of the Seventy-fourth Street power station, which proved inadequate to the load thrown upon it Monday. That period of time, he thought, would be required to restore the damaged generator to first-class operating condition.

"We will be skating upon thin ice so far as coal stocks and adequate power are concerned," said Mr. Hedley. The president of the Interborough conceded that in the last ninety days the company had been forced to buy 60,000 tons of soft coal in the open market to reinforce its regular contract supplies from the Berwind-White Coal Company and the Consolidation Coal Company.

Much of this open market, or "spot" coal, he declared, is of an inferior steam making quality.

The subway lines were not affected by the shutdown.

Will You Do Your Part to Save a Convenience?

The value of a thing is often learned by its loss. That is the predominant thought expressed in "Who Pays the Bill," a pamphlet compiled by C. J. Ferneding, president of the Dayton, Springfield & Xenia Southern Railway, Dayton, Ohio. The pamphlet is a message to all patrons of the railway lines soliciting their protection for the railway service against unwarranted and unnecessary bus competition. Contending that the people will realize what a convenience they have lost with the abandonment of the electric line, he cites the example of the communities of Bellbrook and Spring Valley, which failed to support the branch line of the Dayton & Xenia Railway and accordingly its abandonment was ordered. He says:

> Today these communities would gladly pay two or three times what this service cost them because they have learned its value by its loss and must now pay for inferior bus transportation four or five times what the rail transportation cost them.
>
> Right relations between the transportation company and the public involve something more than laws, city ordinances and court decisions. They depend upon understanding and co-operation between the public and the companies and each needs at times to be reminded of its obligations toward and its dependence upon the other.

He said that the traffic between Dayton and Xenia was sufficient for only one transportation line—an electric line and a bus line could not both survive. Claiming that where there is only enough traffic for one the effects of dividing patronage between two are apparent, he pointed out:

> Every fare paid to the bus line is taken from the electric line and hurts it just so much. If enough of its income is diverted to the bus line to make it impossible to meet its charges it must quit.

In conclusion, Mr. Ferneding urged the reading of this pamphlet and asked the readers to judge whether those who were patronizing the buses and trucks were acting for the best interests of the public and for their own best interests.

More than 5,000 copies of "Who Pays the Bill" have been distributed. They have met with very favorable comments.

Arbitration Will Decide Wage

By an agreement between the Berkshire (Mass.) Street Railway and the trollymen's union on June 19 the question of the new wage scale to replace that which expired on June 1 was to be submitted to an arbitration board of three. Company and men will each appoint an arbitrator, the third to be some person acceptable to both sides. It is hoped to reach a prompt decision and avert all danger of a tieup. Under the old scale the maximum pay is $4.80 a day for blue uniform men. The company wanted to reduce the wages 10 per cent, and the men sought a 10 per cent increase.

Several conferences were held recently and the trolleymen rejected a proposal to leave the question to a board consisting of the district court judges of Berkshire County.

Fresno Has New Franchise

Service-at-Cost Ideas Applied to Fifty-Year Grant to California Road—Railroad Commission Approves Exchange of Obsolete and Undesirable Term Franchises for Modern Indeterminate Grants

THE LAST steps have been taken in connection with the new franchise in Fresno, Cal. The grant was passed by the Council on Feb. 16. It was approved by the Chamber of Commerce of Fresno on April 19. The Railroad Commission sanctioned the grant on May 3 with certain reservations. The company has since accepted it. The date of acceptance was May 13.

The new agreement was under negotiation many months. It amounts to an indeterminate permit, for although the ordinance is drawn for a period of fifty years, it is to be renewed at the end of that time if the property has not been purchased by the city. If the city elects it may purchase the property of the company at the end of any ten-year period by paying for it at its physical valuation at the time.

The company is relieved of all paving obligations in so far as it is possible to grant such relief under the laws of the State of California. It is also relieved of all franchise taxes. The company is assured of a fare that will return operating expenses, taxes and 8 per cent on a valuation to be determined by the Railroad Commission. In short, the integrity of the investment is assured, as is a return of 8 per cent upon the valuation regulated by the increase and decrease in fares.

Some of the more important provisions of the franchise are as follows:

That the right as provided by law is reserved, should the need of the city require it, to grant franchises to other persons to construct, operate and maintain street railways or other methods of transportation within said city subject to the laws of the State of California, provided that this clause shall not be construed to deprive the company of the right to lawfully oppose the granting of any such franchise where its interests are affected thereby.

The city of Fresno will not, except as obligated to do so by the laws of the State of California, require the company by or under any proceedings hereafter to be taken by the "city" to pave, repave, macadamize or remacadamize any part of any street over which the company is now operating lines or over which it may hereafter operate lines, in connection with paving under proceedings hereafter taken, provided, however, the company shall maintain and keep in repair all paving between the rails and tracks and 2 ft. on each side thereof.

That the company shall on or before Feb. 15 of each year file with the City Commission and the Railroad Commission a full and complete report in such form and containing such matters as required by the Railroad Commission of the State of California and upon such report, subject to the approval of the Railroad Commission of the State of California, the rates of fare to be charged on the lines of this company, in the city of Fresno shall be such as to allow said company to earn gross amount sufficient to pay "operating expenses and taxes"; and a return at a reasonable rate per annum upon the "capital value" as such terms are defined in this franchise.

When it shall appear that the existing rates of fares are giving a return in excess of a reasonable return per annum as evidenced by the earnings of the whole or proportionate part of the preceding calendar year, during which time said rates were in effect, then on or before Feb. 15 of next calendar year the company shall notify the Railroad Commission and the commission, and if approved by the Railroad Commission it shall lower such fare 1 cent, such reduction to be effective April 1 following; and if the rates of fares shall fail to yield a reasonable return during the period and under the conditions above specified, then the company shall on or before Feb. 15 of the next calendar year notify the Railroad Commission and the commission, and unless objected to by the Railroad Commission shall increase the rate of fare 1 cent, which increase shall be effective April 1 following.

It is the intention that the rate of fare shall not be changed more often than once in twelve months. Except as from time to time otherwise determined by the Railroad Commission as measured by the rates of return found reasonable in connection with the operation of public utilities, such reasonable rate of return shall be deemed to be 8 per cent per annum. Nothing in this franchise shall be construed as limiting the right now accorded by law to any person or persons from presenting any applications to the Railroad Commission as are now allowed by law to be so presented to such Railroad Commission.

That the commission may by an affirmative vote of four-fifths of its members declare an extension of the service of the company to be a public necessity and call upon the company to make such extension and upon the failure of the company within a reasonable time to be fixed by the commission to make such extension, the commission may make an application to the Railroad Commission asking for an order requiring such extension to be made. The matter of the reasonableness of such extension and the terms thereof shall be left to the jurisdiction and the order of the Railroad Commission and should said Railroad Commission order said company to make such extension, it shall be its duty to, and it must, make such extension within a reasonable time, provided that, if the company is dissatisfied with said order, and appeals, or seeks a review in the courts, it shall not be required to make such extension until the final determination that said order, or such modification thereof as is made, shall become final. All extensions shall become a part of the aggregate property of the company and shall be operated as such and be subject to all the obligations and reserved rights contained in the city charter and this franchise and shall terminate herewith and be terminated as provided herein and the city does hereby grant to the company the right to construct and operate such additions and extensions as the city shall by ordinance require the company to make subject to all the conditions and obligations herein and will, if deemed necessary or desirable by the company, by grant, again grant such authority.

That in the event of the extension of the corporate limits of the city, so as to take in other and additional territory not now a part of said city, any franchise to operate a street railway or any part thereof, held or claimed by the company in or for any part of such annexed territory shall thereupon be surrendered to said city, and the rights and obligations of this resettlement franchise shall thereupon automatically extend to such additional territory and to said railway, and any part thereof situated therein, and the value of said railway property so included in said territory shall likewise be added to the capital investment of said company within said city, and be considered in the fixing of rates within said city and in fixing the valuation, in the event the city shall elect to take over the property of the company.

That this resettlement franchise shall not be, in whole or in part, nor the railways constructed or operated thereunder, leased, sold, assigned, or otherwise transferred, without the express consent of the city, evidenced by an ordinance, passed by the commission.

That this resettlement franchise is granted upon the express condition that the city shall have the right to terminate this franchise, and to acquire by purchase, or otherwise, all property of the company within said city used and useful in the operation of the railways under this resettlement franchise, and all extensions hereafter granted and made, and such other property within said city of the company as shall be determined by the city to be of prospective usefulness in the public service, ten years from the adoption of this ordinance, and upon each ten-year period thereafter, upon giving the company six months' notice of its intention, at a valuation of the said physical properties of the company, agreed on between the company and the city, or if they cannot agree, at a valuation to be lawfully fixed and determined by the Railroad Commission. Should the city elect to terminate this franchise and acquire said property, if the city and company cannot agree, the city shall promptly apply to the Railroad Commission for an appraisement and valuation of said properties.

The valuation so lawfully fixed shall be conclusive on the parties, and if the company shall be operating lines of railway outside of the city, but in conjunction with its lines within the city, and shall have a bonded indebtedness hereafter covering the whole, such Railroad Commission shall have the right, on demand of the city, to apportion the bonded indebtedness as between the properties within and without the city. The city, if the valuation of said property within the city shall exceed the bonded debt, or the part thereof apportioned to the property within the city, may assume the bonded debt, as a part of the purchase price, and pay the difference in money.

The city must, within one year after the valuation fixed by the Railroad Commission has become final, or in event of litigation within one year after final determination thereof, either pay to the company, in lawful money of the United States, the value fixed by said Railroad Commission, or assume the bonded indebtedness and pay the company such difference, and, provided further, however, that any and all mortgages or deeds of trust hereafter given to secure the lien of any bonded indebtedness shall contain suitable provisions to carry into effect the clauses contained in this franchise pertaining to the settlement and division of such bonded indebtedness, but, in reference to any deeds of trust or mortgages now existing upon said properties given to secure such bonded indebtedness, the said company shall, in the event of sale, at the request of the city, reduce said bonded indebtedness to a sum not in excess of $30,000, and, in the event of such sale and purchase by the city, the said city shall have the right and privilege to retain a sum sufficient to cover such bonded indebtedness with interest and to retain the sum until such bonded indebtedness has been liquidated by said company and upon such liquidation, the said sum with interest so retained shall be paid to said company.

Any extensions or betterments made by the company after the appraisement, and before completion or purchase, shall be added to value fixed by the Railroad Commission and become a part of the purchase price, but no such betterments or extensions in excess of a total of $1,000 shall be made without the consent of the commission. Upon payment in full by the city to the company of the purchase price, or payment partly in money and partly by the assumption of indebtedness, the company agrees to execute necessary surrenders, grants, releases and conveyances, and to deliver to said city possession of said property.

In fixing the valuation of the property owned by the company for any of the purposes considered in this franchise, only the value of the property devoted to public service shall be included, provided, however, in case of purchase by the city, property of prospective public use may be included at option of the city.

It is further agreed that any valuation of the properties of the company by the Railroad Commission for the purpose of fixing rates shall not be binding upon nor estop either the Railroad Commission or the city, whether fixed after a contest or adjudication or by consent of said city, for any purpose except that of fixing rates, and when and if the city demands a valuation for purpose of acquisition, the Railroad Commission shall fix and appraise the physical properties of the company anew

Digitized by Google

as they then are, and no prior adjudication or determination shall be conclusive.

The city reserves the right, in the event that the present law of the State of California in reference to taxation of public utilities should be abandoned, to levy and collect reasonable taxes and license fees, if authorized by the laws of the State of California to do so.

The term of this franchise and of all the rights and privileges hereby granted, shall be fifty years from and after adoption of this ordinance, provided that the city shall have the right to, and such right is expressly reserved, terminate this franchise whenever the city determines to acquire the property of the company ten years after the adoption of this franchise, and at the end of each ten year period thereafter, upon giving the company six months' notice thereof, and the company, by its acceptance of the provisions, conditions and limitations of this franchise, assents thereto and agrees to transfer said properties in accordance with the provisions in this ordinance contained.

Prior to the passage of the ordinance, the Fresno Traction Company operated under what is known as short-term franchises, ranging from six to thirty-nine years, all of which carried stringent requirements with respect to paying for paving, bearing taxes, etc. About two years ago the city of Fresno requested the company to spend more than $100,000 for paving, most of which was in outlying districts of the city and along streets with franchises running for thirty-nine years. Between these streets and the business section of the city, however, the company had franchises that ran for only six years. There was no way that the city could assure the company that the shorter-term franchises would be extended.

Future Financing Assured

Under the circumstances it was, of course, impossible for the company to obtain money to carry out such improvements. After a very thorough investigation of the entire matter, including an inquiry into the necessity for electric railway extensions so as to permit the city to expand, the City Commission appointed a very representative committee of business men further to investigate the needs of the city and to report on the measure of relief that might be extended to the railway. This committee recommended an indeterminate franchise, leaving the terms of the franchise entirely up to the City Commission and the company. After a great deal of discussion the resettlement franchise was granted.

The Railroad Commission, in a decision announced on May 4, authorized the company to substitute the resettlement franchise for the franchises that existed previously and to subject the new franchise to the lien of an outstanding mortgage aggregating $680,000.

As has been indicated previously the new franchise is of the cost-of-service type with provision for an annual adjustment of fares upon an earning basis and also provides for the acquisition of the traction properties by the city at ten-year intervals. In pointing out that these provisions are not directly involved in the present proceedings the commission reserved its right under the Constitution and the Public Utilities Act not to be bound by them.

In discussing the franchise in general the commission, in an opinion written by Commissioner Chester H. Rowell, said:

> This commission has on several occasions expressed its opinion of the desirability, from the standpoint of the public, of exchanging obsolete and undesirable term franchises for more desirable and more modern indeterminate franchises. While under its charter, Fresno is not in a position to grant a full indeterminate street railway franchise, the franchise before us represents an improvement over the franchise to be surrendered and the city may under the new franchise look forward to improved street car service, able to keep pace with the rapid growth of the city. From the standpoint of the company's bondholders the franchise exchange is a desirable step and one tending to enhance the value of the security.

The provisions in the franchise referring to rate making are held to be recommendatory, as the state law, the commission points out, gives it paramount jurisdiction in all rate matters.

Commissioner Comments on Settlement

In commenting on this feature Mr. Rowell said:

> In my opinion, the most that this section of the franchise can accomplish is to indicate to the commission the basis on which the city of Fresno is willing to have this commission proceed in the fixing of street railway fares and the extent of the profit which it is willing the company should earn from its street railway operation. Under the constitution of the State and under the Public Utilities Act this commission has sole jurisdiction in the matter of the fixing of rates. It follows that nothing contained in this franchise can absolve the commission from its duty to fix fair and reasonable rates and it must in the fixing of such rates be controlled, of course, by the facts as they will be developed in any particular case under its own methods of investigation and in its own best judgment. It must be understood, therefore, that the commission cannot be bound in any rate proceeding by definitions or interpretations of terms such as "capital value," appearing in the resettlement franchise. This matter was discussed in the hearing by the presiding commissioner with counsel for the city and for the company and there appeared to be general agreement as to the paramount rate making authority of this commission.

The decision expressly reserves for future consideration the question of the validity of the section of the franchise providing for the acquisition of the railway properties by the city at ten-year intervals.

Wage Reduction Announced

The International Railway, Buffalo, N. Y., announces a wage reduction of 2½ cents an hour for all platform men employed on its lines, effective July 1, with corresponding adjustments in the hourly rates of all other employees. This not only applies to the local lines of the International in Buffalo, Niagara Falls, Lockport, Tonawanda, North Tonawanda and Lancaster but to the interurban lines between these points.

At present the platform men of the International are paid a flat rate of 55 cents an hour; electric and truck men employed in the carhouses, 47½ cents an hour, and car washers, 40 cents an hour. Last August the International reduced the wages of its platform men from 60 to 55 cents an hour with a corresponding adjustment in the wage scale of other employees. No notice of the new wage scale was given the locals of the Amalgamated Association, but notices were posted in all carhouses and stations.

News Notes

Can't Use Trolley Poles for Radio Stunts.—The Toledo Bowling Green & Southern Traction Company, Findlay, Ohio, has forbidden users of radio equipment to attach aerials to its poles.

Railway Freed from Paving Expenses.—By a vote of 1,103 to 719, the citizens of Mankato, Minn., voted at a special election to change the Mankato Electric Traction Company's franchise so as to free the railway from all paving costs, assessing against the property owners the cost of paving on the car roadbed. The railway company will continue to be liable for the cost of street repairs.

Railway Service Suspended.—Mexico City is without electric railway service as a result of a strike of the employees of the Mexican Tramways. A general strike is expected. The manager of the company, which is British owned, claims that he has granted the last concession to the workers and that he is prepared to shut down the railway service for an indefinite period.

Must Pave or Remove Tracks.—The Board of Public Utility Commissioners has granted the petition of the Borough Commission of Vineland, N. J., for an order to the Millville Traction Company etiher to pave along its tracks in Landis Avenue or remove the rails. The company is given thirty days in which to comply with the order. The borough is paving Landis Avenue, the principal business street, but the trolley tracks interfere with the work.

Strike Expense Heavy.—The Transit Commission recently forwarded to Corporation Counsel O'Brien the report of an audit of its accountants in connection with the strike on the Brooklyn Rapid Transit system in 1920. According to this report the total expenditures to operate on the Brooklyn Rapid Transit system during the strike amounted to $2,483,483. This figure corresponds very closely with the estimate of $2,567,393 contained in the report of Receiver Garrison made to the court and noted in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 19, 1921, page 382.

No Wage Agreement Reached.—Wage negotiations with the employees of the Chicago Surface Lines have been held frequently but no offer has yet been made public. Whatever scale is finally agreed upon will become effective on July 2. Union officials have suggested that the city donate its share of the net receipts toward the companies' loss of revenue so the cut in wages will not be so severe. No early action is likely on this suggestion because the City Council contemplates an early adjournment.

Financial and Corporate

Reorganization Approved

New Company at New Orleans Will Be Known as the New Orleans Public Service Corporation

The New Orleans Railway & Light Company is to be rechristened the New Orleans Public Service Corporation and its outstanding capitalization is to be reduced from approximately $70,000,000 to between $45,000,000 and $50,000,000. This is in accordance with the reorganization plans adopted on June 12 by the several committees, representing various classes of security holders, says the New Orleans *States*. The details of the plan were released for publication on June 19.

The reorganization plan is the outcome of more than three years of negotiations between the city and the security holders to put the company on a sound financial basis and improve service. It represents a final agreement between the different mortgage holders of the company as to what they get out of the scramble.

The new plan will be presented to the United States court for approval. The plan calls for a foreclosure of the general mortgage of the company and the establishment of the new public service corporation. The court, it is understood, will approve the plan and the necessary court orders will be made and the new company will start operation some time this fall.

The new company will institute 7-cent car fare and $1.30 gas under an agreement with the city.

Three outstanding features of the reorganization plan are: The $20,000,000 common stock of the old company is completely wiped out; the new company will be authorized to issue $100,000,000 of new first and refunding mortgage bonds; between $10,000,000 and $15,000,000 of new money will be put into the company immediately.

The reorganization plan will affect the several classes of securities of the company about as follows:

The $11,245,000 underlying securities receive 100 per cent on the dollar.

The $18,502,000 4½ per cent general mortgage bonds will receive 25 per cent in cash, and the balance in new 4½ per cent general lien bonds. The new general lien bonds will be junior to the proposed $10,000,000 to $15,000,000 of first and refunding mortgage bonds.

The $5,010,000 Series "A" 5 per cent bonds will be refunded into new 6 per cent income bonds, on a basis of 84.34 per cent on a dollar. The series "B" junior bonds will be exchanged on a basis of 435 French francs for 516 francs, or $55 in new 6 per cent income bonds for every 516 francs at the option of the holder.

The present preferred stockholders will receive all of the stock of the new company, to be distributed "pro rata." The amount of new common stock to be issued by the new company will be determined by deducting all of the debts of the company from the valuation figure of $44,700,000 fixed by the city. The amount will probably be about $5,000,000.

Receiver certificates, taxes, car purchase certificates, etc., will be paid out of new money to be put into the company.

More than 90 per cent of the bonds have been deposited with the committee, and an extension of time made to July 1 for additional deposits. No bonds will be received after that date. Coupons due on July 1 will only be handled by the depositaries on all bonds previously deposited with the committee.

The terms of the ordinance under which the company will operate in the future and the general plan for the financial reorganization of the company were reviewed at length in the ELECTRIC RAILWAY JOURNAL for May 6, pages 761 and 765.

Twenty-fourth Report Submitted

At the twenty-fifth ordinary general meeting of the British Columbia Electric Railway, Vancouver, B. C., held in London in February of this year, the twenty-fourth annual report of the directors with respect to operation for the year ended June 30, 1921, was read. The chairman in the annual address said that the statement submitted showed that the revenue for the year had been well maintained, which justified recommending the declaration of final dividends.

The gross earnings for the year ended June 30, 1921, which exceeded $9,500,000, showed an increase of $824,259 as compared with the previous year. This increase was almost completely offset in increased working costs, due mainly to increased wages granted in October, 1920; to increased cost of materials and to increased taxes, so that according to the chairman's statement the net earnings only gained to the extent of $43,929. The development of the territories served is reflected in the traffic statistics. In 1920-1921 the company carried 71,065,275 passengers, as compared with 66,411,030 in 1919-1920.

On the subject of earnings, the chairman said that the net earnings which the company made were not the result of high charges, but were due to a high standard of efficiency and to economical management. In support of this statement he said that the 6-cent fare in Vancouver, Victoria, West Minster and North Vancouver was among the lowest railway charges in Canada.

Will Finance Organization

Electric Bond & Share Will Back Purchase of Memphis Utilities—Improvements Will Result

It was recently announced in Memphis that the Electric Bond & Share Company of New York City would finance the organization of two companies which will buy the property, assets and liabilities of the Memphis Gas & Electric Company and the Memphis Street Railway. This agreement is said to have been reached at a conference of representatives of the companies, New York financiers, receivers and attorneys for the two local companies.

The two new companies will be organized immediately, with the present stockholders and New York financiers having the controlling interest, it was stated by Lovick P. Miles, of the law firm of Wright, Miles, Waring & Walker. Mr. Miles is counsel for the two corporations. Plans for formulating the two companies with as little delay as possible were discussed at the conference. The companies, according to Mr. Miles, probably will be organized in New York City by the Electric Bond & Share Company and then transferred to Memphis.

SEPARATE CAPITAL STOCK AND STOCKHOLDERS

The Memphis Gas & Electric Company will be turned over to one of the new companies about Aug. 15, when extensive improvements will be made, including enlargement of the present plant, H. C. Abell, vice-president of the Electric Bond & Share Company, announced. The financiers had not decided when the property of the Memphis Street Railway would be disposed of to the other company. Those in attendance at the conference held in Mr. Miles' office in the Bank of Commerce Building were: J. K. Newman, Isadore Newman & Son, New Orleans, bankers; H. C. Abell, vice-president Electric Bond & Share Company, New York; T. B. Udum, counsel for the New York Bond Company; Percy Warner, Nashville, capitalist; T. H. Tutwiler, receiver for the Memphis Street Railway; J. T. Ramier, receiver for the gas company; Frank Elgin, receiver for both companies, and Attorney Miles. Mr. Newman is well known in Memphis, having been formerly with the Memphis Street Railway. He was manager of the interests that controlled the company some years ago.

The two companies that are to be organized will be separate, having separate capital stock, different stockholders and different officers, Messrs. Abell and Miles said. Questioned as to what benefits the Memphis public would receive from the local corporations changing hands, the financiers said many improvements would be made in both companies. The gas company will be enlarged, but at this time they would not say what changes would be made in the service of the street car company.

Dividends Resumed in Philadelphia

Stock of the Philadelphia Rapid Transit Company Placed on a 6 per Cent Basis with Quarterly Payments of 1½ per Cent—$250,000 to Be Divided Among the Employees

T. E. MITTEN, president, explained to the stockholders of the Philadelphia Rapid Transit Company in a statement on June 19 that the result of operation for the year thus far, as evidenced by income account for five months ended May 31, 1922, shows the ability of the men and management to earn 6 per cent on P. R. T. stock. Operating expenses to May 31 include $250,000 for the co-operative wage dividend. He says that the operating economies, as promised by the men, will provide for the full co-operative wage dividend, and will also enable the company to establish higher standards of service to the public.

The board of directors accordingly declared dividends of 3 per cent, or $1.50 per share, payable July 31, 1922, to stockholders of record July 15, viz.:

Quarterly dividend No. 1, for period January-March, 1922, 1½%, or 75 cents per share.

Quarterly dividend No. 2, for period April-June, 1922, 1½%, or 75 cents per share.

In his statement to the stockholders Mr. Mitten explains that the P. R. T. property valuation proceedings in the fare complaint, now before the Public Service Commission, have been in progress for more than two years. He says final determination can be reached only after appeal and judgment of the courts, which will, in the light of experience in comparable cases, consume an even longer period. Meantime the present 7-cent fare with four tickets for a quarter is assured of continuance, under the Public Service Company Law. He says further that the legal standard upon which rates are to be determined is the present fair value of the property devoted to public use and that P. R. T. proved value, at present reproduction costs, is much in excess of the amount required to justify P. R. T. present net income. Mr. Mitten says:

Co-operation of elevated employees has effected marked economy in operation of elevated trains. These saving will be reflected in a higher standard of service. On July 1 new train schedules will be put into effect on the Market Street Elevated, providing a much larger percentage of seats to passengers carried.

Co-operation of surface employees in 1922 has made marked economies in surface operation. Economies in excess of dividend requirements are also to be here reflected in improved service to the public. The ability to operate the number of additional surface cars required depends largely upon the degree of assistance rendered by the city in clearing downtown tracks of vehicular obstruction during rush hours, and also upon elimination of the numerous and extended delays now caused by unloading coal wagons, and by long interruptions to service at steam railroad crossings.

Philadelphia car riders and P. R. T. have both suffered because of continued warfare between city and company. The basis of agreement reached for operation of Frankford Elevated and Bustleton surface line includes an understanding between Mayor Moore, President Weglein of City Council and President Mitten, by which the city government will hereafter co-operate with Mitten Management when city and company interests are mutual.

P. R. T. will operate Frankford Elevated and Bustleton surface line, beginning Nov. 5, 1922, for a period of five years. P. R. T. pays rental of 1 per cent during 1923 on construction cost of Frankford Elevated; rental to be increased 1 per cent annually until a maximum of 5 per cent is reached. This contract may be extended by the city so as to terminate in 1957 with the 1907 city agreement.

Additional high-speed and surface lines, Mr. Mitten explains, are essential to the uninterrupted growth of Philadelphia. Should the city decide to make the original investment required, there still remains the necessity of additional income to offset the operating deficit of the first few years, and to pay such return on city money as may be agreed upon. Mr. Mitten continues:

Increasing the fare would be impracticable, unpopular and of questionable value as a means of increasing net income. The elimination of wasted effort, as represented by unnecessary lines and duplicated service, is therefore essential in building up P. R. T. ability, through these savings, to support added investment.

Mitten Management is not only endeavoring to increase P. R. T. net income, so as to support unprofitable extensions required for city expansion, but in so doing is endeavoring to apportion service to the needs of every district, and to avoid excess service to one district at the expense of another.

Market Street Elevated service west of Sixty-third Street, city limits, is now sufficient to supply a seat for every passenger carried. The attempt of suburban lines to force P. R. T. to run all elevated trains to Sixty-ninth Street is opposed by Mitten Management, because this excess service, costing $150,000 per annum, would reduce the ability of P. R. T. to supply needed service elsewhere.

Mitten Management has consistently opposed duplication of service to Germantown, as contended for by certain complainants. The cost of this additional service, $250,000 per annum, approximates the operating loss estimated to follow first year's operation of the proposed Roosevelt Boulevard line. The Germantown district now receives adequate service at about one-third the fare paid on steam railroads.

Mitten Management discontinued trolley freight on June 1, 1922, because of the inroads of motor-trucks, which have lately been carrying the best paying freight, and for the further reason that trolley tracks

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over, except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on street and interurban railways in the United States. †Revised weighting.

Digitized by Google

overburdened with passenger traffic should not be used for trolley freight.

PROPERTY IMPROVEMENT

Continued co-operation with the city, in its extensive program of repaving, will require rebuilding upward of 60 miles of track construction during the year. This, together with other necessary expenditures for renewals and improvements, will require approximately $4,000,000.

Appropriations from earnings during 1922 for maintenance and renewals are on the same basis as in 1921. $3,000,000 of the amount so set aside, representing renewal of existing property, will help to meet the $4,000,000 construction budget. The remaining $1,000,000, representing betterments and additions to property will, as heretofore, be financed from the renewal reserve. As against the application of renewal fund moneys for the replacement of existing property, the integrity of present property investment is preserved equally well by the use of these moneys for the acquisition of new and additional property.

This method of financing P. R. T. capital requirements will be used until P. R. T. dividend earnings ability is sufficiently established to make its securities salable under the terms of the 1907 city agreement, by which new capital must be obtained from P. R. T. stock sold at par, or by use of P. R. T. guarantee, which must be sufficiently good to make bonds issued for construction purposes readily salable.

An initial payment of 2 per cent was made in 1916. The company paid 2½ per cent semi-annually from Jan. 31, 1917, to January, 1920. In July, 1920, the dividend was passed and none has since been declared.

Good Showing Continues in Charlottesville

At a recent meeting of the directors of the Charlottesville & Albemarle Railway, Charlottesville, Va., a 3½ per cent semi-annual dividend on the preferred stock of the company was declared, while a 4 per cent semi-annual dividend was ordered paid on the common stock for the six months ended June 30, 1922. The earnings of the company continue to increase rapidly. The company still maintains a 5-cent fare and the passengers carried for the month of May, 1922, totaled 143,657, or a daily average of 4,661. This is an increase over May, 1921, of 11,254. The net surplus for the five months ended May 31, 1922, after the payment of all fixed charges, including the dividend on preferred stock, is $39,280, an increase over the same period in 1921 of $11,727.

Railway Operations Cease

The Bridgeton & Millville Traction Company, operating between those two cities and touching Fairton, Cedarville, Newport, Dividing Creek and Port Norris, ceased operations on its lines on June 15. This did not include the local lines in Millville. Despite every effort on the part of the City Council of Bridgeton, the city has been left stranded without adequate transportation, as the Board of Public Utility Commissioners granted the company's application to abandon on June 15.

Because four different parties have been considering buying the trolley line, the City Council has decided not to grant licenses to a number of bus operators who have applied for permission to run in Bridgeton and to towns formerly served by the trolleys. Hence no adequate bus system is ready to fill in the breach, although a few individual buses will probably be given temporary permits.

The Bridgeton & Millville Traction Company started operation in 1893 and is abandoning its lines at this time because it declares they have not paid for two years. Unless the trolley franchise is purchased at once the city will turn to bus service and probably grant franchises in a short time.

Commission Defers Abandonment

The Public Utilities Commission of Ohio in hearing the application of J. H. McClure, receiver of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, to abandon its branch line from Lima to Defiance decided that operations should be pursued to Sept. 1 to demonstrate the possibilities of this portion of the system being operated without loss. The commission found that this track had been operated for more than five years and that service upon this branch had been maintained at an actual financial loss. The commission in its finding ruled that a verified report be filed on or before Sept. 20, 1922, showing revenues and expenses to Sept. 1, 1922. The same decision was handed down on the application for two other branch line abandonments. This matter has been referred to in a previous issue.

Another Twin City Common Dividend

The Twin City Rapid Transit Company, Minneapolis, Minn., has declared a dividend of 2 per cent on the common stock payable July 1 to stock of record June 15 and the regular quarterly dividend of 1¾ per cent on the preferred stock, payable July 1 to stock of record June 15.

President Horace Lowry in commenting on the declaration of a 2 per cent dividend on the common stock, stated that disbursement was a semi-annual payment in the hope and expectation that it will be possible to keep the stock on a $4 annual basis.

The dividend on the common stock was passed in June, 1918. Including 1919, and up to present time, it has been the custom to pay annual dividend on the common when result of year's operations is known. Last year an annual payment of $4 was made. A $2 dividend was declared last February, which, with the present payment, brings dividends so far this year to $4.

Commission Allows Sale of Equipment Trust Notes

Subject to the approval of a trust agreement and lease, the California Railroad Commission, on June 10, authorized the San Francisco-Oakland Terminal Railways to issue and sell at not less than 99 per cent of their face value and accrued interest $600,000 of 10-year 7 per cent serial equipment trust notes. The proceeds are to be used to pay in part for two new ferryboats, now under construction at an estimated cost of approximately $900,000. The new boats will be of steel hull construction, electrically driven, with a passenger carrying capacity of 3,000. The company's boats at present in service carry a maximum of 2,000 persons.

The equipment trust notes authorized in this order will mature at the rate of $60,000 a year and will be callable at par and accrued interest on any interest payment date. Under the terms of the trust agreement the trustee will hold title to the ferryboats, which will be operated by the company under a lease agreement. This arrangement, it is pointed out, has the effect of obligating the company to pay the notes.

Financial News Notes

Change in Name Effected.—The name of the Richland-Ashland Railway, Petersburg, Va., has been changed to the Richmond-Ashland Railway.

Name of Property to Be Changed—The name of the Arkansas Valley Railway, Light & Power Company has been changed to the Southern Colorado Power Company. The new name is calculated to indicate more clearly the extent and location of the territory served by the company, which comprises five counties covered by 317 miles of transmission system centering in Pueblo.

Co-Receiver Appointed.—William S. Harmon, Columbus, Ohio, has been appointed co-receiver with George Whysall of Columbus of the properties of the Springfield (Ohio) Terminal Railway & Power Company in the foreclosure suit of the Central Trust Company of Illinois. Mr. Harmon was appointed by Judge John E. Sater of Columbus and the entry of his appointment filed in the United States District Court at Cincinnati. The bond of the co-receiver is fixed at $10,000 and has been given.

Change in Ownership Announced.—The Tiffin, Fostoria & Eastern Electric Railway, Tiffin, Ohio, is about to change hands. The Tiffin & Fostoria Railway incorporated June 15, at Columbus, will purchase the property of the Tiffin, Fostoria & Eastern. The deal involves a change in the ownership through the admission of Toledo parties, according to officials. The incorporators are C. F. M. Niles, Justice Wilson and U. G. Denman of Toledo, S. B. Sneath 2d and R. R. Hays of this city. Mr. Niles and Mr. Sneath are interested in the Tiffin, Fostoria & Eastern and Mr. Hays is manager of the line. There will be no change in policy as a result of the change of ownership, it was said by officials of the Tiffin, Fostoria & Eastern.

Traffic and Transportation

Federal Hearing Conducted

Application of San Francisco-Oakland Terminal Railway to Reclaim Goat Island Discussed

A special commission composed of one representative each from the Departments of War, Commerce and the Navy conducted a hearing in San Francisco on June 12 to give all interested parties an opportunity to present opinions and objections on the application of the San Francisco & Oakland Terminal Railways for permission to reclaim 170 acres of shoal land adjoining Goat Island and to construct thereon a Union Terminal for the use of interurban systems, automobiles and transcontinental railroads.

Major General Lansing H. Beach, chief of engineers, U.S.A., was chairman of the hearing, Admiral A. S. Halstead, commander of the Twelfth Naval District, represented the navy and C. H. Huston, Assistant Secretary of the U. S. Department of Commerce, represented that branch of the government. Col. Herbert E. Deakyne, San Francisco office, Engineer Corps, U.S.A., served in an advisory capacity.

J. S. Drum, chairman of the board of the railway, reviewed the trans-bay traffic situation and the advantages of the proposed terminal, pointing out that the company was quite willing to have other transportation companies join in the project. Edward M. Boggs, consulting engineer for the company, presented the engineering aspects of the plan. In his opinion bridge or tunnel projects that would supplant the ferry service for commuters was in the far distant future and meantime, at a reasonable cost, the present eighteen to twenty-minute ferry trip of 2.85 miles could be reduced to a ten-minute trip of about 1.6 miles. Last year the ferries of the Southern Pacific and Key Route systems combined handled 45,000,000 trans-bay passengers.

Representatives from other companies and neighboring cities expressed interest in the plan but nothing tangible was raised in the form of objections. Based on the hearing and the conclusions reached after a first-hand study of local conditions, the committee is to make recommendation to Congress, by which body final action on the application must be taken.

Railway Concludes Its Case Before Master

The Public Service Railway, Newark, N. J., has concluded the presentation of its testimony before Special Master Haight, sitting at the instance of United States Circuit Court Judges Wooley and Rellstab, to pass upon the question of the continuance of the 8-cent fare. The special master announced that he expected to resume the hearing very shortly with the appearance of the representatives of the Board of Public Utility Commissioners and counsel for the cities. The present 8-cent fare is being collected under a temporary order of the court, pending a full determination of an adequate charge. The 8-cent fare was authorized by the court on an appeal to that body by the railway from the order of the commission fixing the fare at 7 cents.

Record Established on New South Wales Government Tramways

A record number of passengers carried and revenue earned was established during the two Easter weeks of this year on the New South Wales Government Tramways, Sydney, N. S. W. The number of passengers was 13,075,925, against 12,828,639 for the same two weeks a year ago. Only 1,200 passenger cars were available for this and the ordinary city services. The revenue for the Easter weeks of 1922 amounted to £147,764, or an increase of £1,939 over the same period a year ago. These figures were disclosed in a report to the Railway Commissioners by Traffic Manager E. J. Doran giving details of the total traffic handled by the city and suburban trains during these two Easter weeks.

Committee Reports Against Five-Cent Fare

Proposed legislation for the Boston (Mass.) Elevated Railway and some of the other trolley lines in Massachusetts has been so wild that it has not merited serious consideration. When at last it came time for the Legislature to act it put a decided stop to the attempts to hamper the Boston company, leaving the Elevated just where it was at the beginning of the legislative year.

The principal agitation was for a 5-cent fare in Boston. Mayor Curley proposed it in his campaign speeches. He pledged himself to the people to secure it for them, and offered legislation to establish it, finally going so far as to propose a tax levy against all the communities served by the Elevated to cover the cost of operation in excess of the 5-cent fare. Of course no city or town wanted to pay the tax, and the State House was stormed in protest when the matter came up for a hearing. Mass meetings for a 5-cent fare have been common features of the city life, people flocking to them in the false hope that the orators would champion the nickel fare, and petitions have been circulated in the streets and have been signed promiscuously. However, the street railway committee of the Legislature reported against the 5-cent fare measure.

Fare Testimony Submitted

International Railway Must Wait Until the Commission Rules on the Reasonableness of Increased Fares

Evidence tending to show that higher rates are necessary on its interurban lines to make up the net deficit and improve the service was presented to the Public Service Commission at a hearing in Buffalo by the International Railway Company. C. P. Franchot, counsel for the company, showed that while the people of Buffalo are riding for a 7-cent fare, only 5 cents is charged in Niagara Falls, Lancaster, Tonawanda and North Tonawanda and 6 cents in Lockport. Such fares, he said, are inconsistent and inequitable and should be made uniform.

During the first four months of 1922, the deficit amounted to $90,000, the commission was told. This deficit consisted of the net loss to meet fixed charges on property. R. H. Horton, traffic engineer of the Philadelphia (Pa.) Rapid Transit Company, submitted fare schedules from 151 cities of the United States, which showed that 29 communities were paying less than 6 cents; 30 were paying 6 cents; 35 were paying 7 cents; 39 were paying 8 cents; 3 were paying 9 cents and 25 were paying 10 cents.

William S. Rann, corporation counsel of Buffalo, upon the orders of the City Council, has written to the Public Service Commission urging the immediate restoration of the 5-cent fare in Buffalo. It was pointed out that the 7-cent fare or four tokens for 25 cents was granted as a temporary measure and conditions which prevailed at that time no longer exist and the commission should order the return of a 5-cent fare immediately.

The commission has already ruled that it would not permit the International to put its proposed increased rates on its interurban divisions and the local lines in Niagara Falls and Lockport until sworn testimony had been taken. The railway has suspended proposed increases in commutation fares until after the commission has ruled on their reasonableness.

Receivers Fight Buses

The receivers of the Steinway Railway, New York, N. Y., have started action in the Supreme Court to restrain the operation of a municipally supervised bus line on Grand Avenue, Queens. This line was authorized by the Board of Estimate on May 26 and charges a fare of 3 cents or two rides for 5 cents. The receivers charge that the bus line competes with their lines and that people who now ride the buses would be patronizing the cars.

The operation of the new bus line was started after the receivers had been sustained by the decision of Justice James C. Cropsey in their right to charge an additional 5-cent fare, at the points of connection with the lines of the New York & Queens County Railway Company, of which the Steinway lines formerly were a part.

Railway Wins Freight Dispute

Ruling that the Philadelphia (Pa.) Rapid Transit Company's freight business was carried on under the trolley freight act, which is permissive and not mandatory, the Public Service Commission recently dismissed complaints against the action of the company in dropping its freight service. When the Philadelphia Rapid Transit Company announced in the fall its intention to suspend freight operation protests were raised on the part of the Philadelphia & West Chester Traction Company, the Lehigh Valley Transit and other companies which had been using this freight service.

When the question was brought before the commission the company postponed carrying out the suspension order until June 1, when, after giving the sixty days' notice, the freight traffic was stopped. The Philadelphia & West Chester Traction Company and the Commercial Traffic Managers' Association have asked the commission for a restoration order. Unless the dispute is carried to a higher tribunal the decision remains that the company will not have to restore its freight service.

Ticket Users Will Approach Eighty per Cent Mark

Chicago is having its first serious experience with tickets on the surface lines. The new rate of fare, 7 cents, with tickets at three for 20 cents, went into effect on June 15. In 1919 tickets were sold through stores and other agencies but the court order which fixed the 7-cent fare also provided that tickets be sold on cars. The result was additional work for the conductors and a noticeable slowing up of traffic. These conditions improved after a few days. No statement was made as to the percentage of tickets used, but President Henry A. Blair said he expected it to reach 80 per cent. The companies have a large quantity of paper tickets on hand but it is said they contemplate the use of metal tokens as soon as a sufficient supply can be delivered.

Conferences Started on Fare Issue

The new Mayor of Seattle, E. J. Brown, has attacked the problem of fare reduction on the lines of the Seattle Municipal Railway by calling a series of conferences with prominent men in the city who are interested in and informed on the municipal railway system. Included in the persons with whom the Mayor will confer is A. W. Leonard, president of the Puget Sound Power & Light Company, who represented Stone & Webster interests in Seattle when the city transacted the purchase of the street railway system in 1919. Mayor Brown states that his conference with Mr. Leonard will not necessarily involve discussion of a revision of the existing contract. In the course of his discussion with John C. Higgins, attorney for the Seattle & Rainier Valley Railway, Mayor Brown said:

> No inroads are going to be made on the general fund of the city for the street railway, with the purchase price for the street car lines at $15,000,000. If a new purchase price is agreed upon, based on a true valuation of the physical properties, it would be reasonable to submit to the voters a proposition to issue general bonds for the railway, but not till then. Under the present impossible contract, the street railway is overcapitalized. That is the whole trouble.

Mayor Brown plans to assemble all possible data before a meeting with the City Council is called to consider the 5-cent fare ordinance introduced by Councilman Fitzgerald and referred to the finance and utilities committee. He has stated that he will oppose the proposed 2-cent transfer charge provided in the ordinance, stating that the people have been promised a 5-cent fare, and that they have a right to expect it, without any strings.

Progress Seen in Traffic Check

The extensive program of the Los Angeles Traffic Commission during the past six months in endeavoring to relieve traffic congestion in the main business district of the city is bearing fruitful results from recent travel checks made in the congested districts and indicates progress in facilitating traffic movements in the downtown districts. A series of time travel checks was made by the commission under the supervision of H. Z. Osborne, Jr., chief engineer of the Los Angeles Board of Public Utilities. The checks were made by fourteen traffic men stationed at the proper intersections, while seven "checkers" in automobiles traversed the principal traffic arteries.

The work of the commission has been augmented and broadened through the co-operation of many commercial and civic organizations in the city. Extensive surveys which have been partially completed by the Traffic Commission will be reviewed, their practicability discussed from every angle and many helpful suggestions are expected to develop which will not alone solve the present problem but those also which the future holds in store. Mr. Osborne in discussing the issue said:

> Traffic congestion is the most serious problem before Los Angeles today and its solution will require the expenditure of millions. The engineers of the California State Railroad Commission in its extensive study of traffic congestion and grade crossing elimination in the city of Los Angeles found that one-third, in numbers, of the city's entire population traversed the dangerous grade crossings in the vicinity of the Los Angeles River daily.
>
> The Los Angeles Railway transports more than 500,000 passengers daily, exclusive of transfer passengers. Every one of these car riders loses from one to fifteen minutes daily because of traffic congestion.
>
> The amount of traffic flowing through city arteries can be increased either by speeding up the rate of flow or increasing the effective street areas. The rate of flow can be increased by some of the following expedients:
>
> Prevent tieups and the crossing of traffic by eliminating left-hand turns. Eliminate the parking of automobiles in the first "dead-line" of traffic during certain hours. Require vehicles for hire to operate from private property. Reroute through traffic so that it does not enter the congested district. Provide "isles of safety" to facilitate the flow of vehicular traffic and the loading and unloading of street cars. Reroute street cars and provide streets and viaducts for automobile traffic only.

Commission Upholds Railway's Fare Schedule

The Public Utilities Commission of Utah recently rendered a decision whereby the Utah Light & Traction Company, Salt Lake City, Utah, will not decrease at the present time its schedule of fares. This decision concludes a case brought by Charles Anderson, Mayor of Murray, Utah, a suburb lying about 7 miles south of Salt Lake City, and others, by petition.

The applicants had set forth that by reason of the decrease in wages and other costs the street car fares should be subjected to reduction. The company replied that, while wages had been reduced, it had been compelled, by reason of deferred repairs during the high price period, to engage a larger force when the prices had come down, and therefore had paid out more money in 1921 than in 1920. The company further stated that no very considerable purchases had been effected of the products on which reduced prices were quoted by Mr. Anderson, but that as a rule prices on finished products had not been materially reduced. The wage scale of employees was still much in excess of that which prevailed before the increases in fares had been granted by the commission.

The commission, in its report, says in part:

> The commission appreciates the attitude of the public mind in the matter of a reduction of rates of street car service. Many have the idea that wages alone control the change in the rates heretofore allowed by the commission. That was not the case. The importance of car fare to the people who are forced to pay the same was and is not overlooked by the commission, and the amount authorized to collect was reached after a most careful investigation and consideration of all the conditions and circumstances attending the giving of such services.

New Orleans' Nocturnal Nomads

A. Morris Buck, New York, representing J. A. Beeler of the Beeler organization, who is conducting a traffic survey at New Orleans, has made an unexpected discovery. If the capacity loads carried by the cars of the New Orleans Railway & Light Company after 9 p.m. and until midnight and thereafter are criterions by which the experts are to be guided, the people of New Orleans are human bats, as the street traffic there is different in this respect from any other city in the United States which Mr. Buck has studied.

Another peculiarity of street car travel in New Orleans is that of Monday travel. There appears to be no difference in volume between Saturday and Monday. One day is as heavy as the other. This is due largely to the fact that the big Canal Street department stores have their bargain sales on Monday. In consequence Mr. Buck has been forced to change his original working plans of the survey, so as to make a special study of the Monday traffic.

Most, but not all, of the big stores in the city of New Orleans are on Canal Street.

Personal Mention

Expansion Makes Staff Changes Necessary

The expansion of the activities of the McGraw-Hill Company has made necessary some changes in the editorial staffs of some of the papers, among them ELECTRIC RAILWAY JOURNAL.

Harold V. Bozell, at present coeditor of ELECTRIC RAILWAY JOURNAL, has been appointed an editor of *Electrical World* in executive charge of the paper. He will, however, continue an active interest in the electric railway field and in the JOURNAL, having been appointed consulting editor of ELECTRIC RAILWAY JOURNAL. H. W. Blake continues as editor of ELECTRIC RAILWAY JOURNAL.

Harry L. Brown, who has been associate editor and Western editor, with offices in Chicago since 1916, has been transferred to New York to become managing editor. Henry H. Norris, who has been managing editor and who has also been directly in charge of the engineering features of the paper, will become engineering editor. This will enable him to devote his entire time to the technical side of the field, including a more intensive treatment of heavy electric traction, thus fulfilling what has been his main wish with respect to his contributions to the publication of the paper.

In Chicago the ELECTRIC RAILWAY JOURNAL office will be in charge of Donald F. Hine, associate Western editor.

These changes are effective July 1.

A. J. Anderson Promoted

Aldon J. Anderson has been appointed general freight and passenger agent for the Salt Lake & Utah Railroad, with headquarters in Salt Lake City. His promotion was from the position of auditor of the road. C. M. Osborne has been made acting auditor.

Mr. Anderson has been with the Salt Lake & Utah, better known as the Orem Electric Railroad, for six years, coming to that road from the Oregon Short Line, with which he had been for ten years.

Mr. Osborne has been chief clerk to the auditor for two years, and prior to taking that position was in the accounting department of the Oregon Short Line.

The promotions were effective June 1.

L. A. Goodrich Traffic Manager

L. A. Goodrich, who has been with the Grand Rapids, Grand Haven & Muskegon Railway, Grand Rapids, Mich., for seventeen years, has been named traffic manager. The announcement was made on June 9, the appointment to be effective at once. Mr. Goodrich started with the company as bill clerk. He was later advanced to the position of freight agent and from there to the post of traffic manager.

His early experience, as Mr. Goodrich tersely puts it, was with the Grand Trunk Railway, in various positions connected with station work. For two years he was telegraph operator at Fuller, the junction of the Grand Trunk, the Pennsylvania and the Père Marquette Railways.

L. E. Moreland's Work Recognized

L. E. Moreland, who has been serving as secretary of the Canadian Electric Railway Association for the past year, was given a special vote of thanks for his strenuous year's work at the annual convention held in Quebec, June 1 to 3. Mr. Moreland will continue to serve until either a permanent secretary is elected or a new secretary is appointed under the present procedure of selecting a man conveniently located with respect to the president's headquarters.

L. E. MORELAND

Mr. Moreland is a young man who has worked his way up in a period of seven years from timekeeper to chief clerk for the Hull (Que.) Electric Company. He was educated in the Ottawa (Ont.) public schools and has stuck to his native locality during his career. Mr. Moreland is twenty-seven years of age.

Mr. Shapiro's Duties Extended

Alexander Shapiro, statistician and assistant in the executive department of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been appointed executive assistant of the Wisconsin Motor Bus Line. This is the name under which the traction company operates its bus service. Mr. Shapiro will continue certain parts of his previous work in addition to his new duties. Mr. Shapiro served with the American Electric Railway Association as assistant in the Bureau of Fare Research, and later as chief of the Bureau of Statistics and Information. He has also made several investigations for the Association's Committee of One Hundred.

Mr. Shapiro has been with the Milwaukee company since 1920, and has been actively working in the executive department and on the transportation committee.

Dr. Herman Humphrey, Louisville, Ky., has been appointed chief surgeon of the Louisville Railway. Dr. L. Ray Ellers has been made associate surgeon.

R. H. Hubbard, general engineer of the Athens Railway & Electric Company, Athens, Ga., has been transferred to Boulder, Col., as general superintendent. H. K. Baker will succeed Mr. Hubbard as general engineer of the Athens property. Mr. Hubbard will be connected with the Western Light & Power Company.

E. O. Shryock, superintendent of railways for the Northwestern Ohio Railway & Power Company, Oak Harbor, Ohio, has resigned to become superintendent of the Columbus, Newark & Zanesville branch of the Ohio Electric Railway. Mr. Shryock has been with the Northwestern Ohio company since 1913, having served with the Meadville & Cambridge Springs Street Railway and the People's Incandescent Light Company.

Phil Harding, traffic manager of the Utah-Idaho Central Railroad, Ogden, Utah, for the past fourteen months, has tendered his resignation. F. L. Whitney of Salt Lake City has been named to succeed Mr. Harding. Mr. Whitney was associated with the Oregon Short Line and the Southern Pacific lines in the traffic department for fifteen years. He has been connected with the United States Fuel Company in the traffic department at Salt Lake for the past six years.

W. D. Pearce, formerly of Forsythe, Mont., has been appointed manager of the Walla Walla Valley Railway, Walla Walla, Wash. The company, which was recently purchased by the Northern Pacific interests, operates the city and interurban lines. Charles S. Walters, who was formerly manager of both the railway company and the Pacific Power & Light Company, remains as manager of the power company and will also be connected with the railway company. W. D. Pearce was formerly trainmaster at Forsythe and has been connected with the Northern Pacific for sixteen years.

Earle W. Hodges, formerly Secretary of State of Arkansas, will be the director of the Arkansas Public Utilities Information Bureau, with headquarters in the Exchange National Bank Building, Little Rock. For the past four years Mr. Hodges has been associated with the Near East Relief organization. His work with the Public Utilities Information Bureau will consist of transmitting news of the utilities to the using public and so bringing about an understanding between producer and

Digitized by Google

the consumer of the service. This bureau, it is stated, will have no connection with the Arkansas Utilities Association.

Obituary

Samuel E. Pingree, former Governor of Vermont, died on June 1. He was chairman of the State Railway Commission from 1886 to 1894.

Harry V. Catlin, cashier of the Detroit (Mich.) United Railway, died suddenly in his office on May 12. Mr. Catlin had been in ill health for some time.

Ira B. Lesh, general superintendent of the Railways Material Supply Company, and president of the Ferguson Furnace Company, died May 24, at his home in Toledo, Ohio. Mr. Lesh went to Toledo three years ago from Philadelphia.

Daniel Coolidge, former president of the Lorain Steel Company, Johnstown, Pa., died recently at his home in Johnstown. He headed the Lorain company from 1899 to 1919, having previously been vice-president and in charge of sales. Until its merger with the Lorain Steel company Mr. Coolidge was connected with the Johnson company. He studied engineering in the East and West after leaving preparatory school, and later became superintendent of the Boston Elevated Railway.

Emerson McMillin, chairman of the board of directors of the American Light & Traction Company, New York, N. Y., died on May 31, after an illness of two days. Mr. McMillin's chief interest was in the consolidation of competing public utility companies, especially gas companies. He became president of the American Light & Traction Company, which controls the Muskegon Traction & Light Company and the San Antonio Public Service Company, in addition to several gas companies. For more than ten years after the Civil War Mr. McMillin was interested in the manufacture of iron and steel and was president of several companies in the Ohio valley.

Joseph Maycock, for more than twenty years railway representative for Pratt & Lambert, Inc., died in Buffalo, N. Y., on June 15. He was one of the best-posted men on the finishing of railway equipment in the country and originated several finishing systems for various railroads. He entered the Buffalo shops of the Erie Railroad after leaving school, and was later master painter. Twenty-two years ago he began selling Pratt & Lambert railway finishes, with headquarters in New York. He gave up his active work with the company several years ago, but retained his connection with Pratt & Lambert until his death. He was a member of several railway associations. Mr. Maycock was born in Oxford, England, in 1843. He came to this country when he was twelve years old.

Manufactures and the Markets

DISCUSSIONS OF MARKET AND TRADE CONDITIONS FOR THE MANUFACTURER, SALESMAN AND PURCHASING AGENT

ROLLING STOCK PURCHASES BUSINESS ANNOUNCEMENTS

Reconstruction of Detroit Lines Going Forward

The reconstruction and repair work necessary on former Detroit United Railway lines is being carried on by the Department of Street Railways. About 7,000 ft. of new track is to be laid on Woodward Avenue. This track will extend from Willis Avenue to Baltimore Avenue and will replace some of the poorest sections now on the Woodward Avenue line. The pavement between tracks will be replaced at the same time and other sections of track and pavement on Woodward Avenue will be repaired while the main reconstruction is in progress.

The Woodward Avenue tracks from Willis to Baltimore Avenue were constructed originally without any foundation, and after a thorough inspection it was decided to make as complete a job as possible. As the other sections can be repaired to last four or five years, they will not be reconstructed this year. Rebuilding of other sections will follow until the entire length of line is of new construction.

Emergency repair work is being done in various parts of the city to remove danger spots due to holes in the pavement and split rails. New trolley wires are being strung over many sections, including the entire Woodward Avenue stretch from the Detroit River to the Boulevard. The overhead lines were found to be in very poor condition as they had been allowed to deteriorate until it was considered that a general breakdown was not far off unless extensive repairs were carried out.

The new track which the city is laying is identical to that laid in other sections of the municipal system, being monolithic concrete type of construction with twin steel ties. New steel and other necessary materials have been delivered along the line and men and machines are working day and night. Temporary tracks have been laid on either side of the street next to the curbs to carry the cars around the section where the new track is under construction. A large number of men have been put to work and all the repairs will be carried out by day labor under the direction of the maintenance department. None of the reconstruction work will be done under contract according to present plans. The rebuilding of the 7,000 ft. of track on Woodward Avenue will necessitate the added expenditure of about $128,000.

Further Details of Boston's New Cars

As announced in these columns for April 29, the Boston (Mass.) Elevated Railway has ordered 100 new surface cars which may be operated either by one or two men as occasion requires. They will cost approximately $10,500 each and will make possible the retirement of box cars and articulated cars. The new cars will represent the best development of present day ideas in surface car construction.

	No. 4 Semi	New Car	Birney Safety Car
Approximate cost	$8,000	$10,500	$6,771
Ton weight—empty	26½	15	8½
Seating capacity	52	48	32
Motors	4-W.H. 306 50 hp. each	4-G.E. 264 25 hp. each	2-G.E. 264 25 hp. each
Control	W-H.L.	K-35	Standard safety car
Width of aisle	28 in.	28¼ in.	22 in.
Width of door	4 ft. 6½ in.	4 ft. 7½ in.	2 ft. 9 in.
Height of car	12 ft.	10 ft. 7 in.	9 ft. 10¼ in.
Over-all length	48 ft. 2¾ in.	45 ft.	28 ft. ¼ in.

The above comparison between the new cars, the No. 4 semi-convertible cars and Birney safety cars gives a clear idea of their characteristics.

Authorizes Expenditure of $84,000

The Board of Public Works has approved an ordinance authorizing the expenditure of $84,000 for reconstruction work on the lines of the Seattle (Wash.) Municipal Railway, as follows: Reconstruction of track on First Avenue South, from Atlantic Street to Stacey Street, costing $12,000; reconstruction of tracks on First Avenue, Pine to Cedar, $31,000; on Second Avenue, Virginia to Cedar, $15,600; adjustment of tracks on Madison Street, First Avenue to Western Avenue, approximately $3,500; reconstruction and overhauling of approximately thirty passenger cars, $17,000.

Metal, Coal and Material Prices

Dayton Companies Go to One-Man Operation

Four of the six street railway companies operating in Dayton, Ohio, are planning to go largely to one-man operation. The Dayton Street Railway purchased and is now operating fifteen new standard safety cars and is also operating some of its old double-truck cars with one man. The latter may be remodeled later, but no change has been made in the construction or equipment to date. The City Railway is purchasing from the Cincinnati Car Company fifteen light-weight, double-truck cars weighing 26,500 lb. complete with quadruple equipment of G. E. 264 motors and Westinghouse air brakes and arranged for single-end, one-man operation. These cars will be fitted with the Syracuse type turnstile on the rear end, and owing to the transfer situation it will be necessary for passengers to pay as they enter. They will therefore enter at the front door and leave through the turnstile by the rear door. To control this operation properly there will be an outside mirror on the front corner post and one inside mirror on the right-hand side of the car so that the operator can see passengers alighting both from the inside and outside of the car. The seating capacity of these cars will be fifty-two. They are constructed with the curve lift sides similar to the interurban cars now operated by the Kentucky Traction & Terminal Company, Lexington, Ky.

The City Railway is also remodeling all of its present double-truck cars for one-man turnstile operation. These cars have drop platforms which, in the rear, will be built up to the floor level and additional seats provided, leaving room for a step up to the turnstile. These cars now seat forty-eight and with the turnstile and additional seats in place will seat fifty-two. The use of Shanklin transfer machines is also being considered to facilitate the one-man operation.

The Oakwood Street Railway is also changing its cars over for similar operation. The Dayton, Springfield & Xenia Southern Railway is remodeling its double-truck cars for one-man operation and employing the standard safety devices. At the present time one car is being operated with a turnstile and "pay-as-you-leave," but it will be necessary to change over to "p-a-y-e" later on account of the transfer situation. The People's Railway and the Cincinnati & Dayton Traction Company are not contemplating one-man operation at this time.

Rolling Stock

Community Traction Company, Toledo, Ohio, will reconstruct cars in the near future for one-man car operation.

Louisville (Ky.) Railway has under construction fifteen one-man cars which it is reported will be put on the Brook and Seventh Street line on Aug. 1.

Interstate Public Service Company, Indianapolis, Ind., has planned to put in operation the five new one-man cars between New Albany and Jeffersonville. The cars were constructed in Cincinnati. Reference was made to this new equipment in the ELECTRIC RAILWAY JOURNAL issue of May 13.

Track and Roadway

Community Traction Company, Toledo, Ohio, has ordered materials to start upon the track improvement program which will require an expenditure of $500,000.

Public Service Railway, Camden, N. J., has obtained permission to shift the Kearns turnout about half a mile to the west so as to even up the running time between Camden and Riverside. Work on this improvement will be started in a short time.

Chattanooga (Tenn.) Traction Company will extend the tracks of the Red Bank line several miles up the Dry Valley district in the near future. The company has the poles for the wires, a large amount of rails and other equipment necessary to the line.

Washington Water Power Company, Spokane, Wash., recently began laying tracks on the nine blocks of double tracking on East Sprague Avenue, which is being installed for the Spokane United Railways as the result of the elimination of the Union Park loop after consolidation takes effect.

Savannah Electric & Power Company, Savannah, Ga., is progressing rapidly on the replacing of the present 50-lb. low T rail on Forty-sixth Street with 7-in., 70-lb. high T rail. This work also includes the construction of a 300-ft. siding. This construction work is being done to serve patrons on the Habersham Street line. The company has also installed a switch at Bay and Whitaker Streets in the eastbound track.

Trenton, Bristol & Philadelphia Street Railway, Philadelphia, Pa., is drawing up plans for a trolley switch and loop at Market and Radcliffe Streets, Bristol, to carry passengers from Philadelphia to the steamers running to Island Beach, between Burlington and Bristol. The plans will be submitted to the Bristol Borough Council at a meeting to be held in July. Minot J. Hill, general manager of the traction company, plans to run an express service from Philadelphia to the island.

Seattle (Wash.) Municipal Railway has completed the newly-constructed First Avenue South-East Marginal Way street car line in the southern end of the city. This event was recently celebrated by the South End Industrial Association. The new route extends over First Avenue south from Spokane Street to East Marginal Way and over East Marginal Way to a junction with the old South Park car line, furnishing a shortened route to the business center of the city, and efficient car service to the industrial workers in the tideflats district along the Duwamish Waterway.

Capital Traction Company, Washington, D. C., has made formal application to the War Department to construct a double-track extension on the new Georgetown bridge and to operate cars between Georgetown and Rosslyn. According to engineers the extension will cost about $150,000. If the War Department approves, residents of nearby Virginia points, now dependent for street car service on the Aqueduct bridge line of the Washington & Old Dominion Company, will not be left without street railway transportation next spring when that company abandons its cross-river service.

Trade Notes

Mason B. Starring, president of the California Railway & Power Company and of the United Railways Investment Company, was elected a director of Burns Brothers Coal Company at the last meeting in May.

Track Specialties Company, New York, N. Y., has announced the appointment of J. S. O'Connor of the Standard Supply Company located at 315 Beatty Building, Houston, Tex., as its Texas agent.

American Abrasive Metals Company, New York, N. Y., manufacturer of feralun, alumalun, vulcalun and bronzalun anti-slip treads, announces that it has also been appointed a representative by the Carborundum Company of Niagara Falls for the Carborundum anti-slip tile.

Dryden Rubber Company, Chicago, Ill., announces that E. H. Young and H. E. Lavalle have been appointed exclusive Eastern representatives, with headquarters at 18 Vesey Street, New York, for the sale of Dryden double-wear friction tape and splicing compound in the New England and Middle Atlantic States.

New Advertising Literature

Wagner Electric Manufacturing Company, St. Louis, Mo., recently issued a folder emphasizing Wagner quality "year after year." The folder contains three calendars for the year 1922 with the months of May, June and July on top.

Rail Welding & Bonding Company, Cleveland, Ohio, has published a new catalog on its type WW dynamotor and its uses, particularly as employed for carbon arc rail joint welding. A special section is devoted to a description of the carbon arc process.

Northern Equipment Company, Erie, Pa., has just published a booklet entitled "Regulating Boiler Feed Water." The subject has been treated through the use of charts showing the effect of feed-water regulation on water input, steam output, feed water temperature, etc.

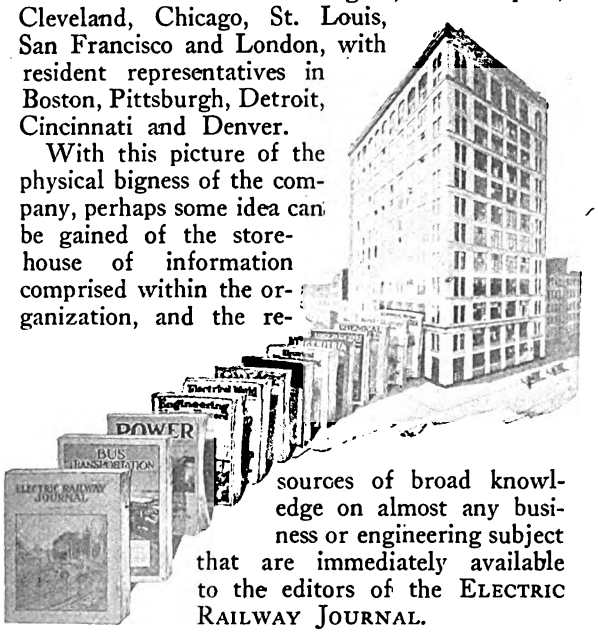
The Backing of Electric Railway Journal

ELECTRIC RAILWAY JOURNAL is produced by the largest industrial publishing house in the world. It was the first property of what now constitutes the McGraw-Hill Company, Inc., with its fourteen internationally known business papers, each the leader in its field. This wonderful growth represents a measure of the high ideals of service and responsibility of James H. McGraw, who has long been one of the outstanding figures of the publishing industry. The character and enterprise of this first property formed the foundation on which was built the present great institution.

Now, the fourteen papers serve more than 180,000 subscribers. Their publication requires the employment of 1,200 skilled workers and highly trained executives. From 5,000 to 6,000 tons of print paper annually are consumed. In the company's composing room in New York men and machines set 6,000 text and advertising pages monthly. In the press room modern cylinder presses turn out 8,000,000 copies of eleven publications yearly, three being published elsewhere. In the bindery almost human machinery binds annually the billion and a quarter pages that make up these journals. In addition to the home office, housed in the company's own fourteen-story building in New York, branch offices are maintained in Washington, Philadelphia, Cleveland, Chicago, St. Louis, San Francisco and London, with resident representatives in Boston, Pittsburgh, Detroit, Cincinnati and Denver.



With this picture of the physical bigness of the company, perhaps some idea can be gained of the storehouse of information comprised within the organization, and the resources of broad knowledge on almost any business or engineering subject that are immediately available to the editors of the ELECTRIC RAILWAY JOURNAL.

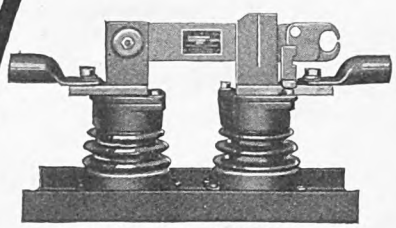
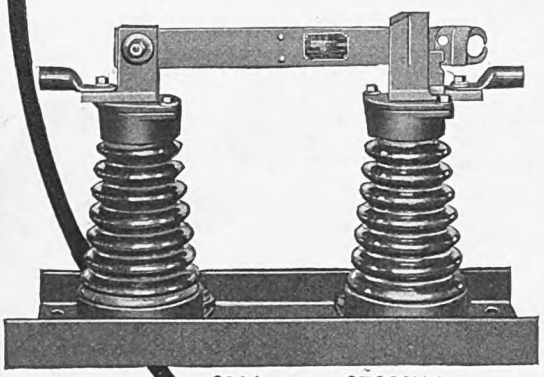
Westinghouse Disconnecting Switches ready for shipment

Discriminating Engineers Specify Westinghouse Type S Disconnecting Switches



200 Amperes, 7500 Volts



200 Amperes, 25,000 Volts

because they stand up under the enormous mechanical strains incident to severe short circuits.

One of the most complete and exhaustive series of tests ever run on disconnecting switches emphasizes these important characteristics of the type S switch.

A lock that is absolutely dependable.

The lock cannot fail thermally because it carries no current.

The lock is not supported by, and is separate mechanically from, the break jaw so that possible spreading of the jaw blades cannot unlatch it.

Mechanical stresses, which act to spread the insulators apart and to blow the switch blade open, only tighten the grip of the type S latch.

The hinge jaw blades are solid (not split) preventing the hinge bolt from pulling out with the resultant opening of the circuit at the hinge jaw.

The hinge and break jaws are permanently sweated and pinned to jaw blocks.

The large head and broad base of the insulators furnish sturdy mechanical support.

Ample cross section of copper parts, and rugged construction of all fittings, assure the full utilization of all the other superior points of construction.

Standardize On Westinghouse Motors and Control

Two essential characteristics determine the selection of a motor that will satisfactorily meet the varied demands of railroad shop drive—*simple mechanical construction* that combines strength and durability with comparatively few parts and with wide interchangeability of parts—exceptional *electrical design* assuring long life and high efficiencies under wide, variable loads.

Check the Westinghouse type SK motor on these points:

MECHANICAL—Only 37 frame sizes and 19 bearing sizes for a complete line of constant and adjustable speed motors, from 1½ to 250 hp. Front and rear bearings are interchangeable.

The frames are made of forged, open hearth steel, which provides great strength with lightness and compact dimensions. The bearings have large area and the shafts are made of axle steel. These are some of the reasons why the type SK motor has been very successful in operating heavy duty planers, wheel lathes, bending rolls and other machine tools.

ELECTRICAL—*Sparkless commutation* assures longer brush and commutator life, gives maximum motor efficiency and practically prevents trouble from burn-outs causing "shutdowns." *Open construction* provides *natural ventilation* that makes cool operation possible under all loads.

SERVICE—Since 1911 the type SK motor has been the Westinghouse standard for d-c. drive. Hence its admirable performance on every type of railroad shop installation. Make your shop produce more, and lower your maintenance bills by standardizing on the type SK motor.

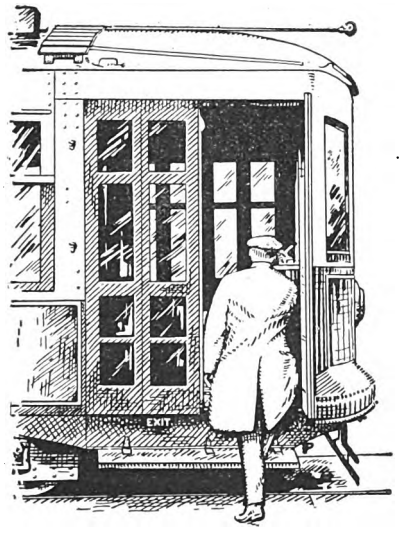
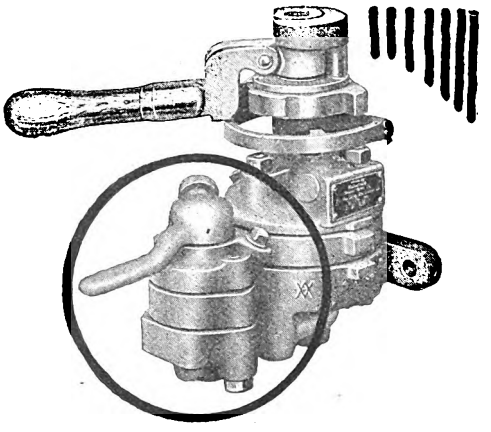
Render your Patrons "Selector Valve Service"





THE new Selector Valve facilitates the operation of double-passage Safety Cars by providing better and safer door control.

Either door—entrance or exit—may be operated independently, or both together, as the situation requires.

The tendency in some cases toward modified Safety Cars, with enlarged loading platforms and double-passage doors, has made the Selector Valve a modern necessity.

Saves time and risk in loading and unloading; increases car miles; gives the operator better supervision over an important part of his job.

We make the Air Brake and Safety Car Control Equipment which makes the Safety Car!

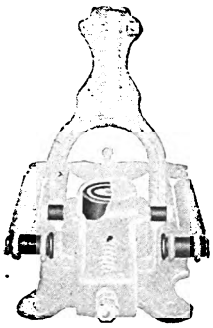
Here are some of the reasons why

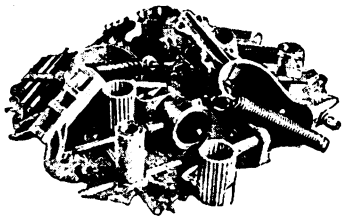
O-B TROLLEY BASE

should be on your cars.



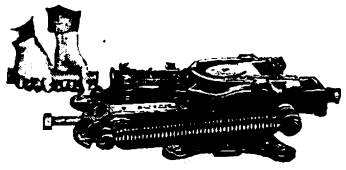
New Base for a few cents

All points of principal wear have renewable bushings—shown dark on the photograph. A few cents and a few minutes puts an O-B Base which has seen strenuous service back in perfect condition.



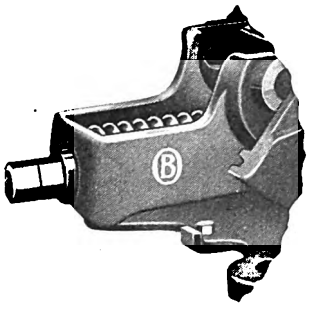
Interchangeable Parts

You can take five or five hundred O-B Bases, tear them down, mix the parts and put them all together again without a hitch. Repair parts fit—chipping, filing or grinding are never necessary.



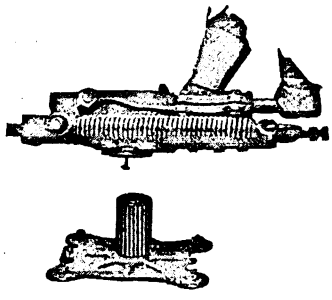
Changing Poles

There is a hook on the O-B Base which locks it, if desired, with the pole in a horizontal position. Poles can be changed in the barn even if headroom is limited.



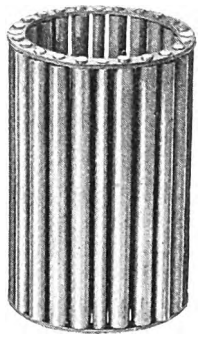
Buffer Spring Absorbs Shocks

If the pole leaves the wire and jumps wild, this sturdy buffer spring on the O-B Base absorbs the shock. It reduces strain on the pole, the base and the car roof.



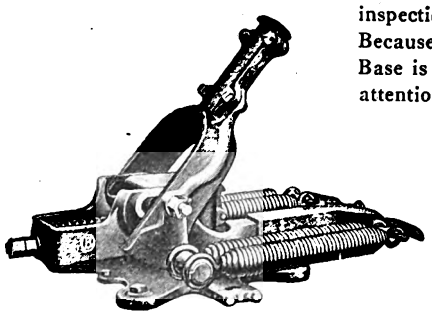
Accessible

One man can lift the O-B Base off its stem casting and expose every vital part for inspection and lubrication. Because it is that easy, O-B Base is sure to get whatever attention it needs.



Twenty Caged Roller Bearings

With the wear divided between twenty rollers, the O-B Base pivots freely—holds wheel to trolley even when track or wire is crooked. Notice that the rollers stand by themselves.



O-B Form 1 Base (Patented)

It Looked Like A $17,000 Job—
But Steel Twin Ties Reduced It to $10,000

On a New York interurban property there was a 2300 foot stretch of worn out patch track laid with a nine inch girder rail, wood ties under which was 6 to 8 inches of concrete.

When the first cost estimate on rebuilding this track was prepared based on removing the old concrete completely the result was about as shown in the table on the left.

Then another estimate was made based on Steel Twin Ties, an 80 lb. tee rail and leaving the old concrete in place. This is easily accomplished with this tie which requires only 3 inches of clearance. (Estimate on the right).

COSTS PER FOOT WOOD TIES	
Remove old track	$1.67
New rail	1.06
Wood ties	.30
Concrete	2.67
Labor	.30
Joints	.08
Paving	1.77
Total	$7.85

If you have a similar job even if you do not have nine inches of clearance Steel Twin Ties will save you dollars too.

Write today giving a short outline of conditions on your proposed work and we will gladly prepare a suggestion for your job.

The International Steel Tie Company
CLEVELAND

COSTS PER FOOT STEEL TWIN TIES	
Excavation to base old rail	$ .67
Steel Ties	1.00
Labor	.20
Concrete Paving	1.77
Rail	1.06
Joints	.08
Total	$4.78

Built Stronger—Last Longer

"Tool Steel" Wisdom-Tooth Pinions

will run with your present gears

While the old B & S standard 14½° tooth may do where gears are not overstressed or subjected to abnormal wear, it is not the strongest tooth available for the abnormal wearing conditions of street railway service. But the thousands of high-grade gears in service with standard B & S teeth cannot be scrapped in order to secure immediate use of more modern tooth shapes, either in 20° angle, in helical or in other types.

"Tool Steel" WISDOM-TOOTH pinions solve this problem by giving a modern shaped pinion tooth and yet one that will run interchangeably with the old gear, quietly, with a normal efficiency in the transmission of energy. The tooth is decidedly stronger than the old standard when new and as it wears, tends to maintain its strength rather than to wear with undercut flanks.

"Tooth Steel" WISDOM-TOOTH pinions have been given careful tests in many types of service, in the railway and mining industry, have been pronounced a decided success in each case and have now been adopted as standard by many large users.

The slight change in gear ratio, due to one less tooth than standard in "Tool Steel" Wisdom-Tooth Pinions, will have no appreciable affect on car speeds. It has not affected operating conditions in the slightest in places where it has been actually tried.

Secure them for trial installation.

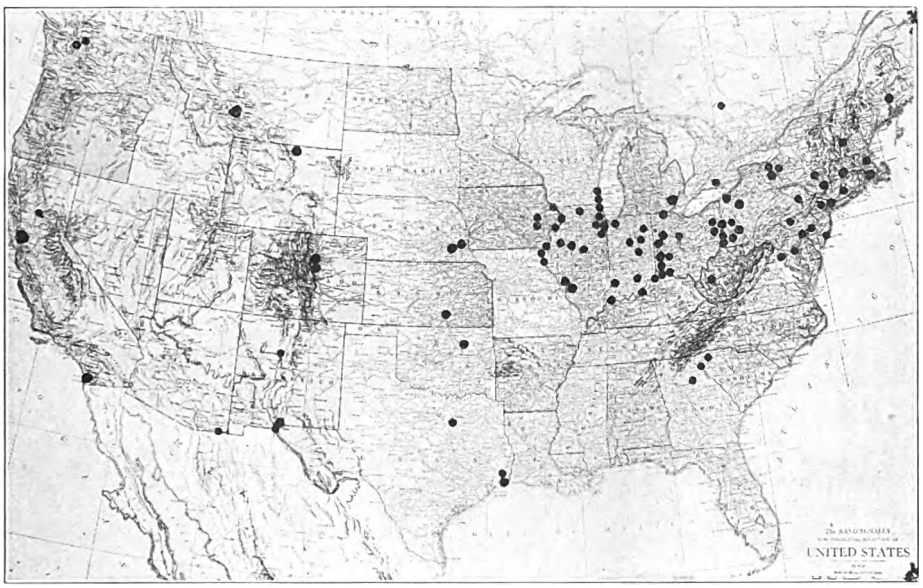
ECONOMY METERS

STANDARD ON OVER 100 ROADS

FOR POWER SAVING AND CAR INSPECTION



Every dot on this map represents a property that has *standardized on* Economy Meters.

It points out a nation-wide interest in car energy metering.

Your road can make savings comparable with the savings which Economy Meters have induced on these properties.

Let us explain, in detail, how Economy Power-Saving Meters tell you without trouble.

"The Watchdog of Your Power and Equipment"

1. WHO are your careful, economical motormen.
2. WHICH motormen need instructing in proper handling of car equipment.
3. HOW much power is being saved by motormen collectively and individually, by direct-reading units of power.
4. HOW much power is being used on any section of your lines.
5. HOW much power is being used in trailer service.
6. HOW much power your freight and express service is using.
7. HOW much power is being used for switching and car movements in yards.
8. WHAT is the line loss on your D.C. distribution.
9. WHEN your schedule speeds are too high or too low.
10. WHAT is the most economical equipment for any service.
11. WHAT are the proper gear ratios for given service conditions.
12. WHEN each car should be inspected.

Cashing in on Desire

People LIKE to ride in motor cars.

The rapid growth of the automotive industry is proof positive of this fact.

People nowadays ride in street cars from necessity, not from choice.

You can cash in on the pleasure-riding desire of the public with a **MITTEN-TRAYLOR MOTORBUS,** "the poor man's automobile.

The **MITTEN-TRAYLOR MOTORBUS** is built exclusively for the purpose of carrying passengers comfortably, safely and profitably.

No railway man would think of attempting to adapt a freight car for passenger service. Isn't it just as illogical to try to make a BUS out of a MOTOR TRUCK?

The exclusive HIFLEX spring suspension gives to the **MITTEN-TRAYLOR MOTORBUS,** on solid tires, the riding qualities of a pleasure car on pneumatics. Roomy, deep-springed seats add to the ease of riding.

This easy-riding feature not only attracts passengers, but keeps down costly repair bills—adds to the life of tires and increases the safety of bus operation.

The Mitten-Traylor Motorbus

is not confined to tracks or set routes. It can leave the hot paved streets of the city and follow the whims of the riding public along pleasant shaded drives.

By catering to pleasure-riding patronage, the most successful bus operator in America has built up this "off-peak" business to an extremely profitable degree.

You too can add to your profits by investing in **MITTEN-TRAYLOR BUSES,** and cash in on the automobile-riding desire of thousands who can't afford a car.

Mitten-Traylor Incorporated offers you the services of its transportation experts for consultation on your problems.

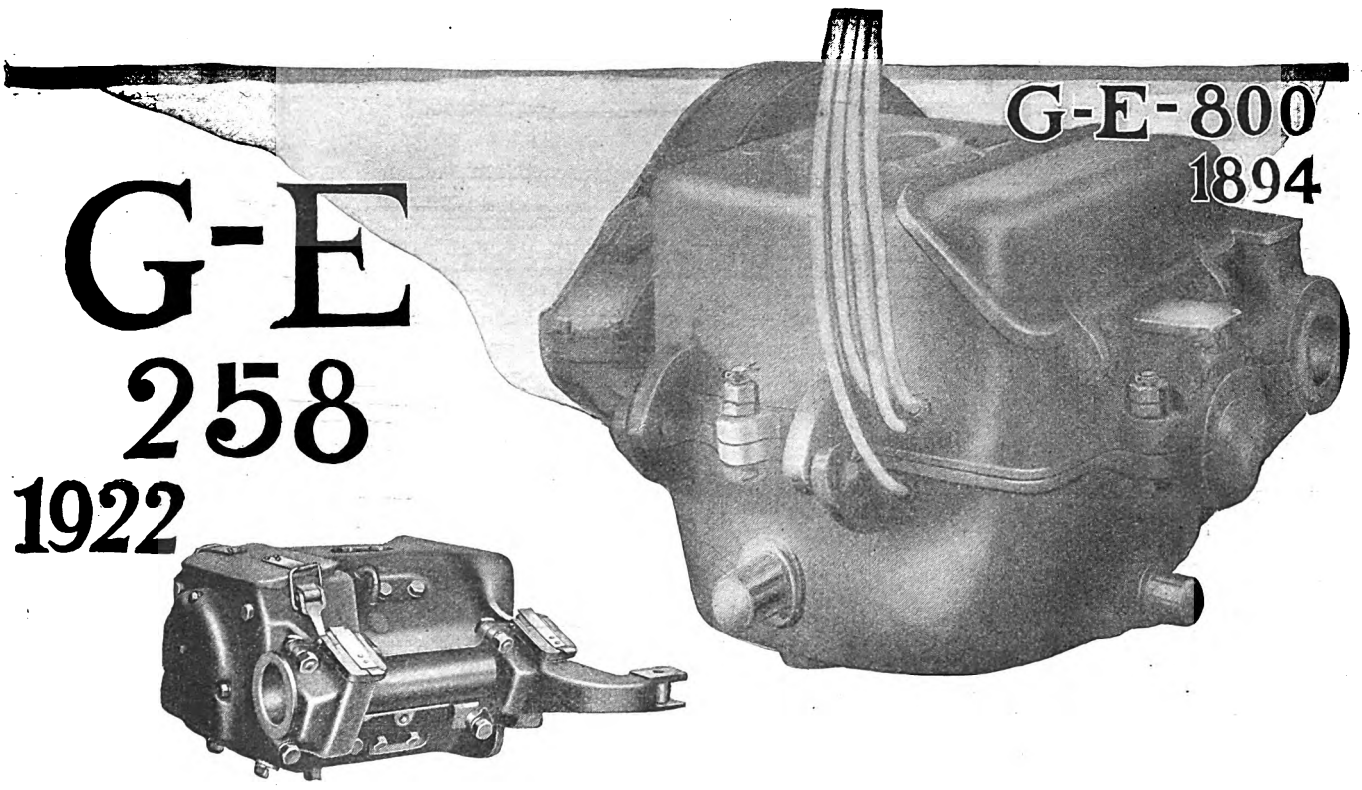
The spirit of true leadership is not merely to get to the front but to stay there



Yesterday and Today in Railway Motors

The GE-800 of 1894 weighed 1930 pounds, which was at that time a comparatively light-weight motor.

The GE-258 motor of today weighs but 885 pounds and is capable of as much work as its distant predecessor.

The old motor was fully enclosed and had no commutating poles, whereas the self-ventilation and commutating poles of the GE-258 give it so liberal an overload capacity that it has become the favorite motor for safety cars and light-weight interurban cars where schedule speeds combined with maximum reliability are controlling factors.

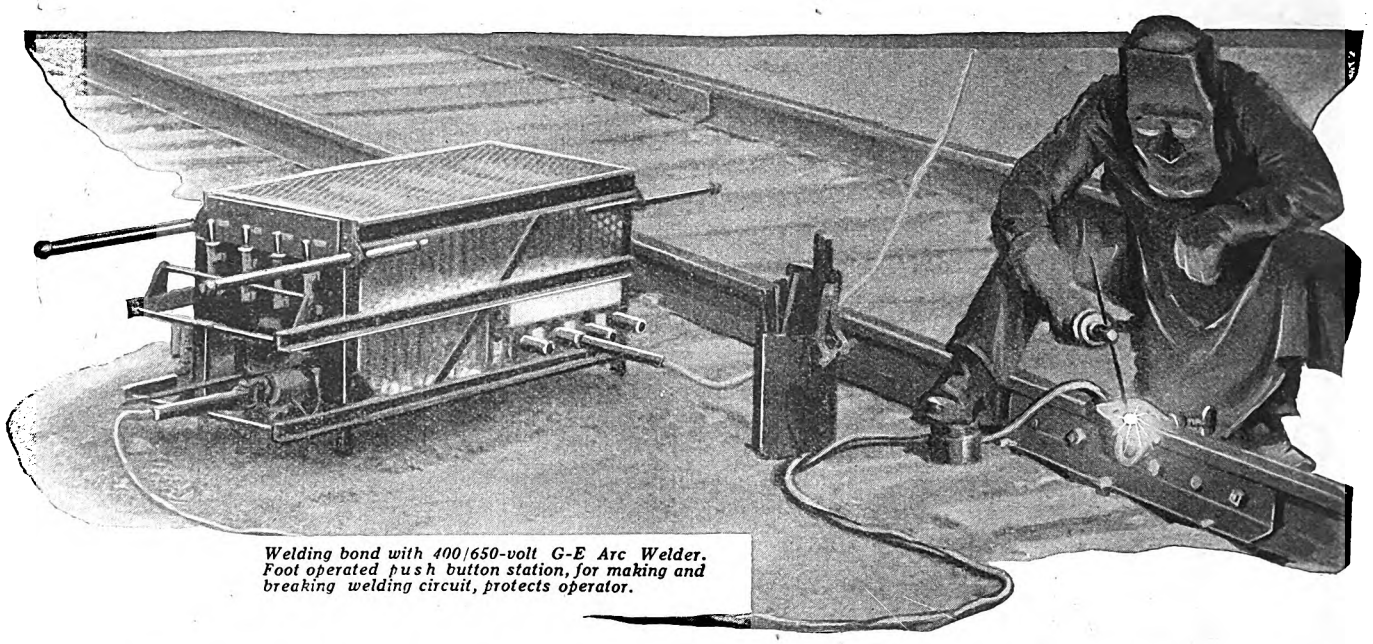
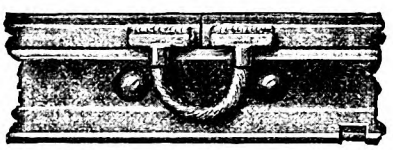
Good Bonding is fundamental to improved service at less cost. Invest in it.

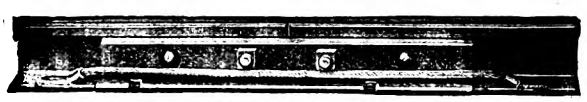


Welding bond with 400/650-volt G-E Arc Welder. Foot operated push button station, for making and breaking welding circuit, protects operator.



Form SF-1, made single and double conductor, for attaching to rail head. Readily applied without tearing up pavement.

Form SF-4 bond with steel terminals to fit the angle between the web and base of the rail.



Form SF-6 for application around the joint plate. Designed to be attached to top of rail flange.

Use G-E Welded Bonds

Think of an unbonded joint as an open circuit—that's what it is, practically. The high resistance causes a voltage drop that you pay for in impaired service and increased cost of repairs to motors operating on abnormally high current. And there is an energy loss that's bound to show up in your power or coal bill.

To do without good bonding is to practice false economy. You might as well try to run machinery without lubrication.

Rails as long as the system and without a joint would be ideal. Impossible, of course. But with welded bonds the track, as an electrical circuit, *is without a joint.* Furthermore, welded bonds are more easily and cheaply applied.

Ask our nearest Sales Office about G-E rail bonds and G-E equipment to weld them.

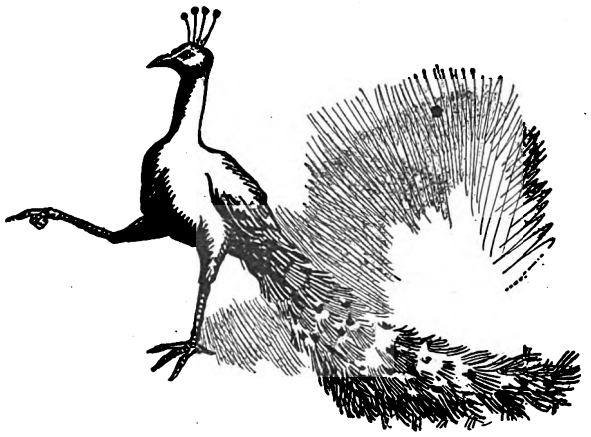
—here is the standard brake for safety cars



the PEACOCK Staffless Brake

A Reputation Established!

1. Not an experiment -- it has been safely satisfying the exacting requirements of safety car service for years.
2. Occupies minimum platform space — the pressed steel housing projects only 3¼ inches into the vestibule from the dash.
3. Has at least three times the power of the ordinary type of hand-brake — and almost unlimited chain-winding capacity.
4. Before being convinced, compare it point by point with any other hand brake made. Consider power, speed, capacity—***and established reputation.***

"Two Bells for Better Business"

"Two Bells!"—Let's start!

The 1922 Convention of the American Electric Railway Association is on the way with its big exhibit to be displayed on Chicago's great Municipal Pier during the first week of October.

The Exhibit has proved to be one of the high spots of past conventions. It has been the feature that built up a big attendance. This year's Exhibit, the first since 1920 and only the second since 1918, will arouse unusual interest and attract increased attention.

As in past years, *Electric Railway Journal* will devote two special issues to helping its readers and its advertisers make the most of the Convention and the Exhibit.

Annual Convention Number

(Dated September 23, 1922)

Convention Report Number

(Dated October 7, 1922)

The two convention issues of the *Electric Railway Journal* will enable manufacturers to capitalize their exhibits and draw visitors, to impress on the field the ideas back of their selling campaigns and to give the entire electric railway industry a strong buying stimulus.

Electric Railway Journal is read weekly—text and ads—by the men who do from 98 to 99 per cent of the world's electric railway buying. This publication therefore delivers to its advertisers by far the largest, most influential and most interested audience that is available anywhere. *Electric Railway Journal* covers the field completely—north, east, south, and west.

Start now. "Give two bells for better business;"—one bell your decision to attend the Convention, the other bell your prompt action in reserving advertising space in the *Electric Railway Journal's* Convention issues. Regular rates apply. Tell us to send you suggestions for an effective piece of advertising copy.

ELECTRIC RAILWAY JOURNAL
Tenth Ave. at Thirty-sixth St., New York

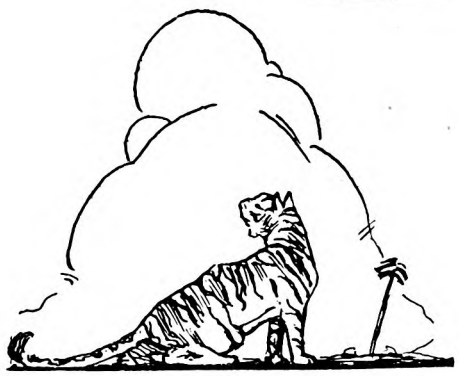
"TIGER" BRONZE



AXLE and ARMATURE BEARINGS

PROVE TO YOUR OWN SATISFACTION—that there is a direct, dollars and cents, saving in the cost of operating cars, equipped with "Tiger" Bronze Axle and Armature Bearings.

Put them to any test and judge them by the service they render, in comparison with any other bearings made.

Your test will prove that "Tiger" Bronze has a very slow and even rate of wear, which results in correct bearing alignment and far greater mileage.

We will be glad to cooperate with you in getting maximum bearing service for your cars at minimum cost. Let us supply you with complete information on "Tiger Bronze."

The lightest insulating base is the strongest

HERE is a switchboard material that combines the qualities of lightness and strength. Johns-Manville Ebony Asbestos Wood has a higher mechanical strength than soapstone, slate, or marble; yet with two-thirds their weight.

Stronger electrically, too

Ebony Asbestos Wood has a higher electrical insulation and puncture resistance than any of these quarried materials, even when they are without flaws—which is not often the case.

Manufactured by formula, Ebony Asbestos Wood is not subject to flaws, cracks, or metallic veins. Every piece is a solid homogeneous block of cemented asbestos fibre impregnated with a highly efficient dielectric compound.

Best for all uses

The result is an insulating base comparable to mica or hard rubber in efficiency. Yet it is rigid, strong, permanent and can be readily worked. High quality demands Ebony Asbestos Wood for all severe requirements—low price justifies it for ordinary use. Send for a booklet.

In the long run

there's
real safety
real service
real economy
in

CARNEGIE Wrought Steel WHEELS

Carnegie Steel Company
General Offices: Carnegie Building, Pittsburg, Pa.
1495-A

432,045 Car Miles

And Apparently Good for as Many More

That is the impressive record of the first Nuttall Helical Gear ever used in Street Railway Service.

That performance has revolutionized the traction gearing problem.

Bulletin 28 explains why

R.D. NUTTALL COMPANY
PITTSBURGH PENNSYLVANIA

Class "ER" Compressors

The small air compressor does not always get the attention or the surroundings given to larger units. Often it stands alone in a corner of the shop. No one pays particular attention to it—especially when the shop is busy.

With their automatic lubrication, enclosed dirt-proof construction, plate-air valves and automatic regulation, Class "ER" Compressors are WORKING OR READY FOR WORK—NOT WAITING TO BE WORKED UPON.

Let us send you a copy of Bulletin 3330, which describes these machines in detail. If you are interested in a similar type arranged for steam drive write for Bulletin 3131.

The Kalamazoo Trolley Wheels

have always been made of entirely new metal, which accounts for their long life WITHOUT INJURY TO THE WIRE. Do not be misled by statements of large mileage, because a wheel that will run too long will damage the wire. If our catalogue does not show the style you need, write us—the LARGEST EXCLUSIVE TROLLEY WHEEL MAKERS IN THE WORLD.

ANNUAL STATISTICAL NUMBER

ELECTRIC RAILWAY JOURNAL

This

"Phono-Electric"

and the THIRD AVE. RAILWAY are friends of old standing

For a decade or more, PHONO-ELECTRIC has served faithfully to keep open the vast traffic arteries in upper New York City. Not only has PHONO-ELECTRIC proved its value on the many curves and cross-overs of this system but on tangent track where wire clearance of only 12 ft. 3 in. requires an *off-set of sixteen inches*, 4/0 Phono-Electric has given five years trouble-free service — and looks good for much more. Such service proves

Phono-Electric
the answer to Why, is WEAR!

Mass Transportation

"Joe," said the Vice-President, "we have accomplished remarkable results in the reconstruction of our old cars to reduce weight and secure economies. Therefore, we're in excellent shape to produce a masterpiece in our new light weight car. What I want you to do is to look into the new 30,000 pound Milwaukee car and let me have your recommendations for 25 new equipments."

"Fine, Boss," replied Joe, "I have been keeping track of recent developments in car designs and believe it worth while to confer with a number of other properties, among which are the Chicago Surface Lines, Twin City Rapid Transit, Connecticut Company and several others who have been working on outfits ranging from 28,000 to 30,000 pounds."

"Obtain all the data you can, Joe, but don't overlook the electrical equipment. For mass transportation, we want Westinghouse motors and HL control for train operation. Either their No. 508, 25-hp. motor, or their new No. 510, 35-hp. motor should do the work."

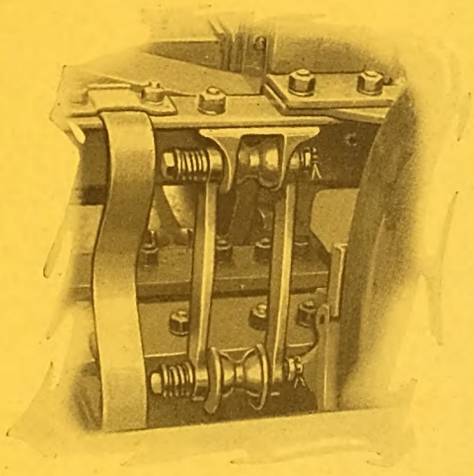
Brill Truck Specialties



The coil spring at top and bottom is kept compressed almost solid. This insures most satisfactory service.

SPRINGS
PINS AND BUSHINGS
JOURNAL BOXES
BRAKE HANGERS
CENTER PLATES

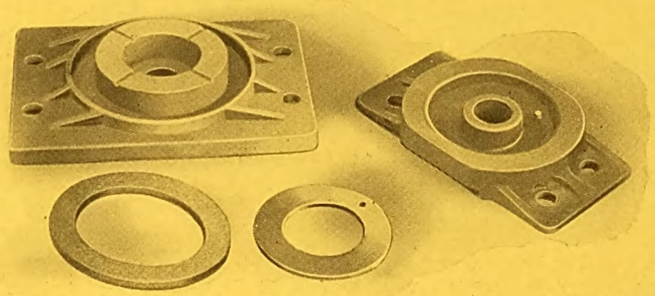
Brill Oil-Retaining Center Plates

A phosphor bronze ring, continually in a bath of oil, a larger felt ring to keep the dust out, and the truck and body center plates, constitute the Brill Oil-Retaining Center Bearing. This lubricated center bearing (a gill of oil lasting a year and a half) lessens flange and rail wear and facilitates smooth and steady riding at curves.

Brill "Half-Ball" Brake Hanger

Every Brill Truck is equipped with this type of brake hanger. This means the elimination of noise in braking, reduction in uneven shoe wear and most satisfactory operation.

The Brill "Half-Ball" Brake Hanger is noiseless, self-adjusting to wear and self-cleaning.



Brill Oil-Retaining Center Bearing.

1921 McGRAW-HILL BOOKS

In the year 1921 we published—

78 new technical books including 14 thoroughly revised editions of standard works—a bookcase full of the best in the modern literature of applied science.

Emphasis on quantity in publishing is always a trifle hazardous, so we emphasize quality.

The books listed below range all the way from practical books for the operator, to advanced and specialized treatises for the engineer—from books on business to scientific agriculture.

Throughout, we believe they maintain the high standard of McGraw-Hill books. They round out the most complete and up-to-date list of books in the fields of applied science available anywhere in the world today. The full list is given in our general catalogue—sent free on request.

ELECTRIC RAILWAY JOURNAL

The Miller Trolley Shoe

is the pantagraph applied to the trolley car

Like pantagraph trolleys on high-speed electric locomotives, Miller Trolley Shoes "stay with" the wire. They handle large currents without arcing or overheating.

Miller Trolley Shoes are attached to your existing trolley poles. No special fixtures required.

This simple device will give every car the equivalent of a pantagraph trolley at trifling cost. *Try them!*

Have you received your copy of our new catalog?

MILLER TROLLEY SHOE COMPANY
BOSTON-21, MASS.

MILLER
Trolley Shoes
(Patented)

—meet every requirement for increased efficiency.

1. The pantagraph applied to the trolley car.
2. Better current collector.
3. Fewer dewirements.
4. Noiseless.
5. No lubrication.
6. Less wear on trolley wire.
7. More miles per dollar.

Freight Haulage

"Joe," said the Vice-President, "our Transportation Engineer's report discloses a lot of new information on Freight Haulage possibilities. He shows that all of the industries on our lines are increasing their force and considerable increase in freight and package shipments will be upon us in a month or so."

"He is right," responded Joe, the Superintendent of Operation. "I gave him an inventory of our available equipment. I am satisfied we should have at least two more Baldwin-Westinghouse Locomotives and, furthermore, we had better order them now, before prices and shipments are extended."

BRILL

VERTICAL HANDLE BRAKE FOR BIRNEY SAFETY CARS

This new type hand brake is now standard Birney Safety Car equipment. The complete revolution of its 9-inch handle makes it possible to take up chain slack quickly and with its two-to-one gear ratio sufficient pull on the brake rod is obtained to guarantee effective braking.

When inactive the Brill Vertical Handle Brake occupies but little platform space, and does not interfere with either the operation of the air brake handle or the folding platform seat.

This Vertical Handle Brake may be purchased complete with staff and brake chain, or for welding to staff of any standard type brake in use.

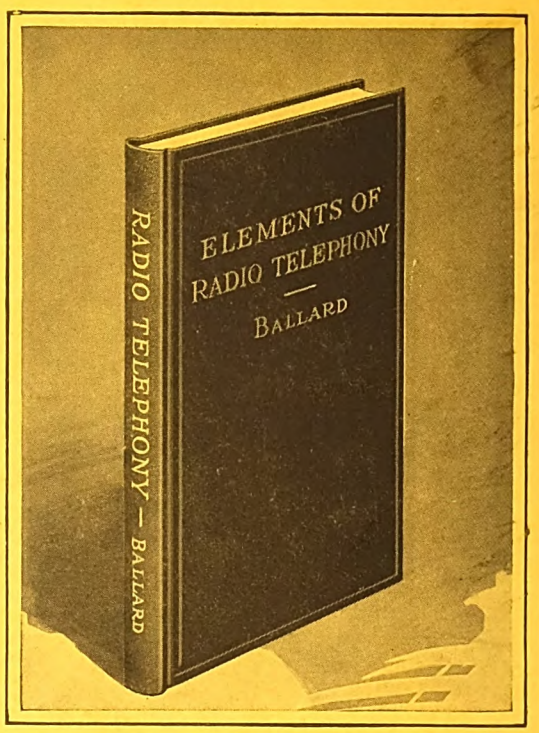
Just the things you want to know About Radio Telephony—



Accurate, reliable information, the work of a recognized authority, yet simple and clear and with no involved mathematics.

There really has been very little of an authoritative nature up to this time on radio telephony.

There have been some "how-to" books for boys and some other semi-technical material for laymen.

But here is a book that covers the subject authoritatively as well as simply and clearly.

Just Out!

Elements of

Radio Telephony

BY W. C. BALLARD, Jr.

Assistant Professor of Electrical Engineering, Cornell University

130 pages, pocket size, flexible, fully illustrated $1.50 net, postpaid

The book presents a brief, simplified discussion of what happens when messages are sent and received by radio.

It gives a clear description of the apparatus required to produce these effects and explains how this apparatus operates.

It furnishes practical, unbiased information for the experimenter who desires certain results but who does not know what apparatus is necessary.

The man with a technical background who wants to read up on radio will find this new book just the book for his purpose.

The specialist in radio will find the book an excellent presentation of fundamental principles and their application.

The book will be of value also to amateur radio operators because Professor Ballard has been in close touch with the amateur organizations of western New York and knows the amateur's problems.

Chapter Headings

1. Wire and Radio Telephone Systems.
2. High Frequency Currents and Their Production.
3. Vacuum Tubes.
4. Vacuum Tube Oscillators.
5. Modulator Systems.
6. Receiving Equipment.
7. Transmission.
8. Miscellaneous.
